

Tools for Implementing Sustainable Water Management

April 11, 2014

Tekla Taylor, R.G.

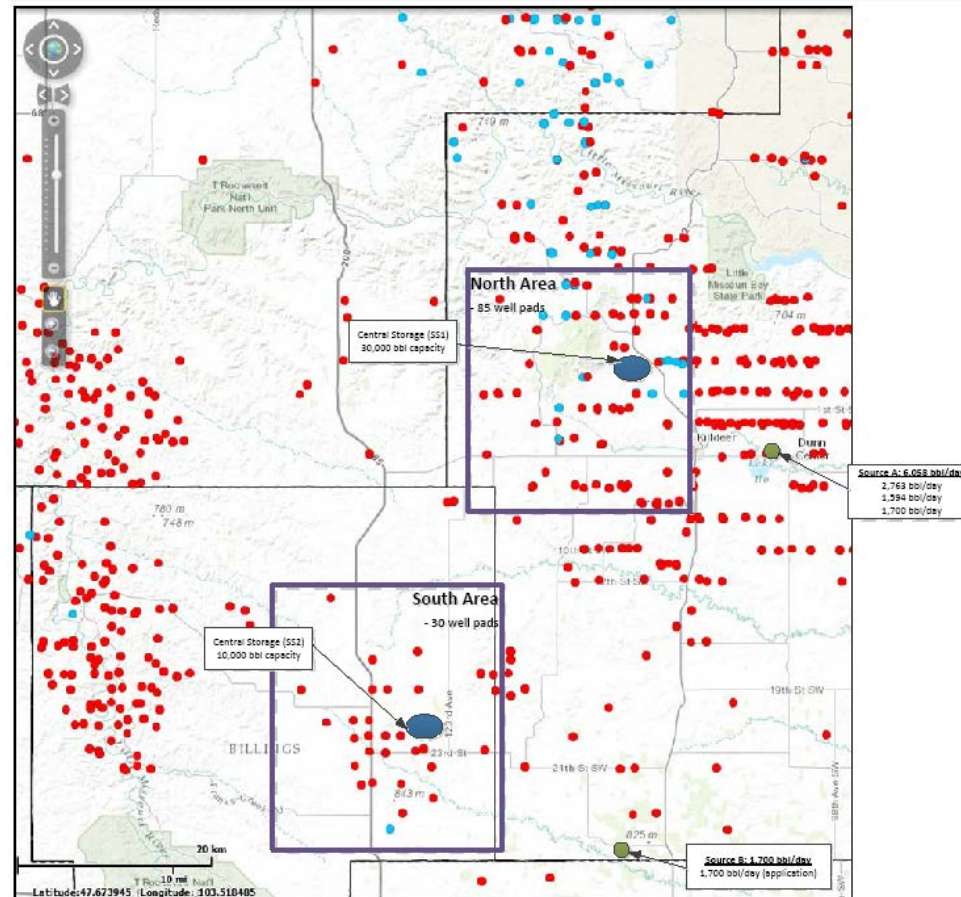

Understanding Water Risk

Using Dynamic Simulation to Predict Water Costs and Risks

Example: Unconventional Oil and Gas Development

Scope and Objectives

- Develop, evaluate and understand water management strategies throughout the entire life cycle
- Evaluate the viability of options to meet project demands
- Identify the most cost effective water management alternatives
- Support early stage engineering and operational decisions
- Optimize water management strategies at later stages of development as field data is collected

Input: Water Source and Disposition Options

Surface water stream

Reuse for well completion

Surface water body

Underground Deep Injection

Surface runoff

Publically Owned Treatment Works

Fresh groundwater

Commercial Water Treatment

Brackish groundwater

Aquifer storage and recovery

Potable water provider

Surface water discharge

Reclaimed wastewater

Agricultural Irrigation

Produced water

Evaporation Pond

Acid mine drainage

Site dust control

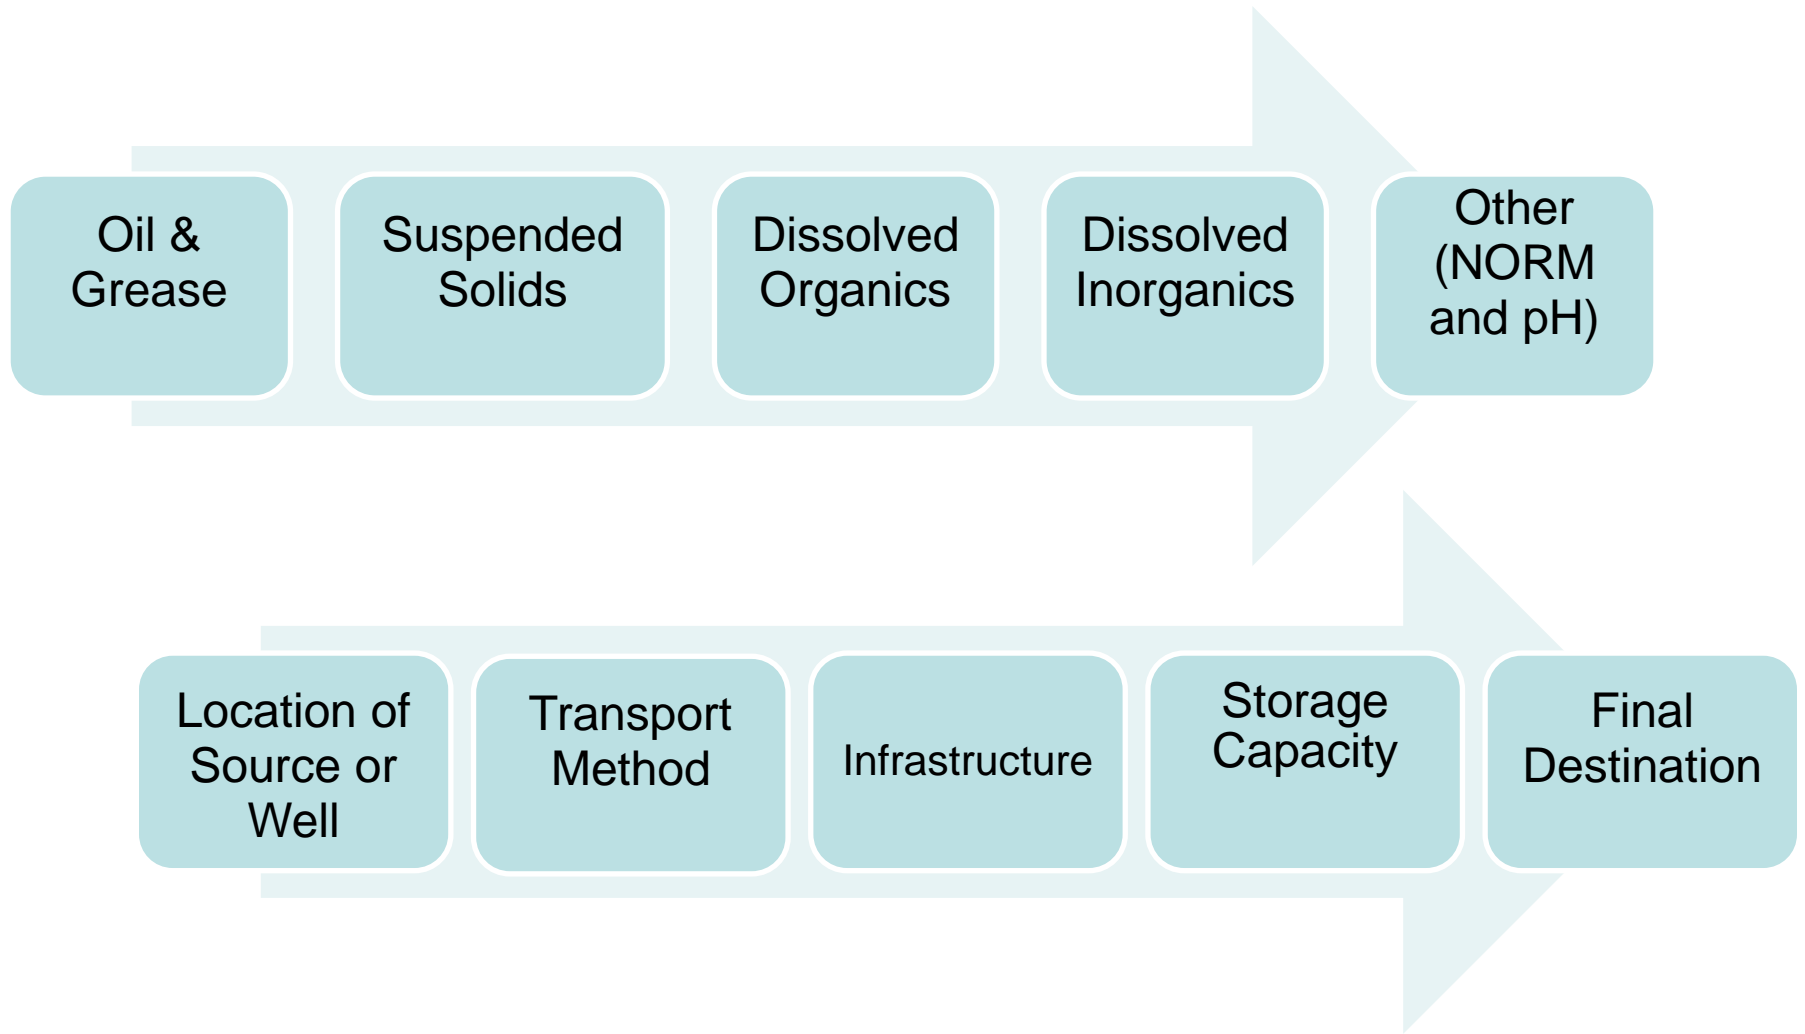

Power plant cooling water

Livestock Use

Industrial Use

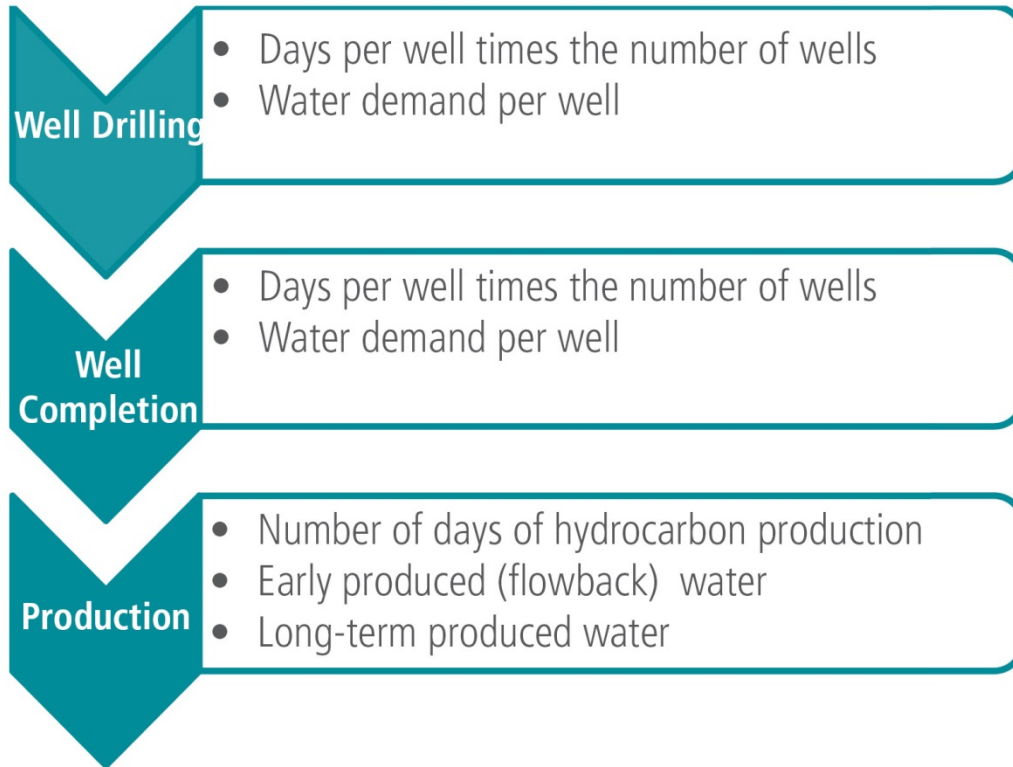

Input: Water Treatment Processes and Logistics

Input: Scheduling

Water Demands

The timeline of events is created to project water demands and production over time.

Develop Water Planning Options and Scenarios

Option	Scenario 1	Scenario 2	Scenario 5
Fresh groundwater source	Truck	Truck	Truck
Brackish groundwater source	Truck	Truck	No
Centralized source water storage	No	No	30,000 bbl
SWD Wells	Truck	Truck	Truck
Reuse	No	Truck	Truck
Storage of flowback water for reuse	No	15,000 bbl	15,000 bbl
Storage of long-term produced water for reuse	No	50,000 bbl	50,000 bbl

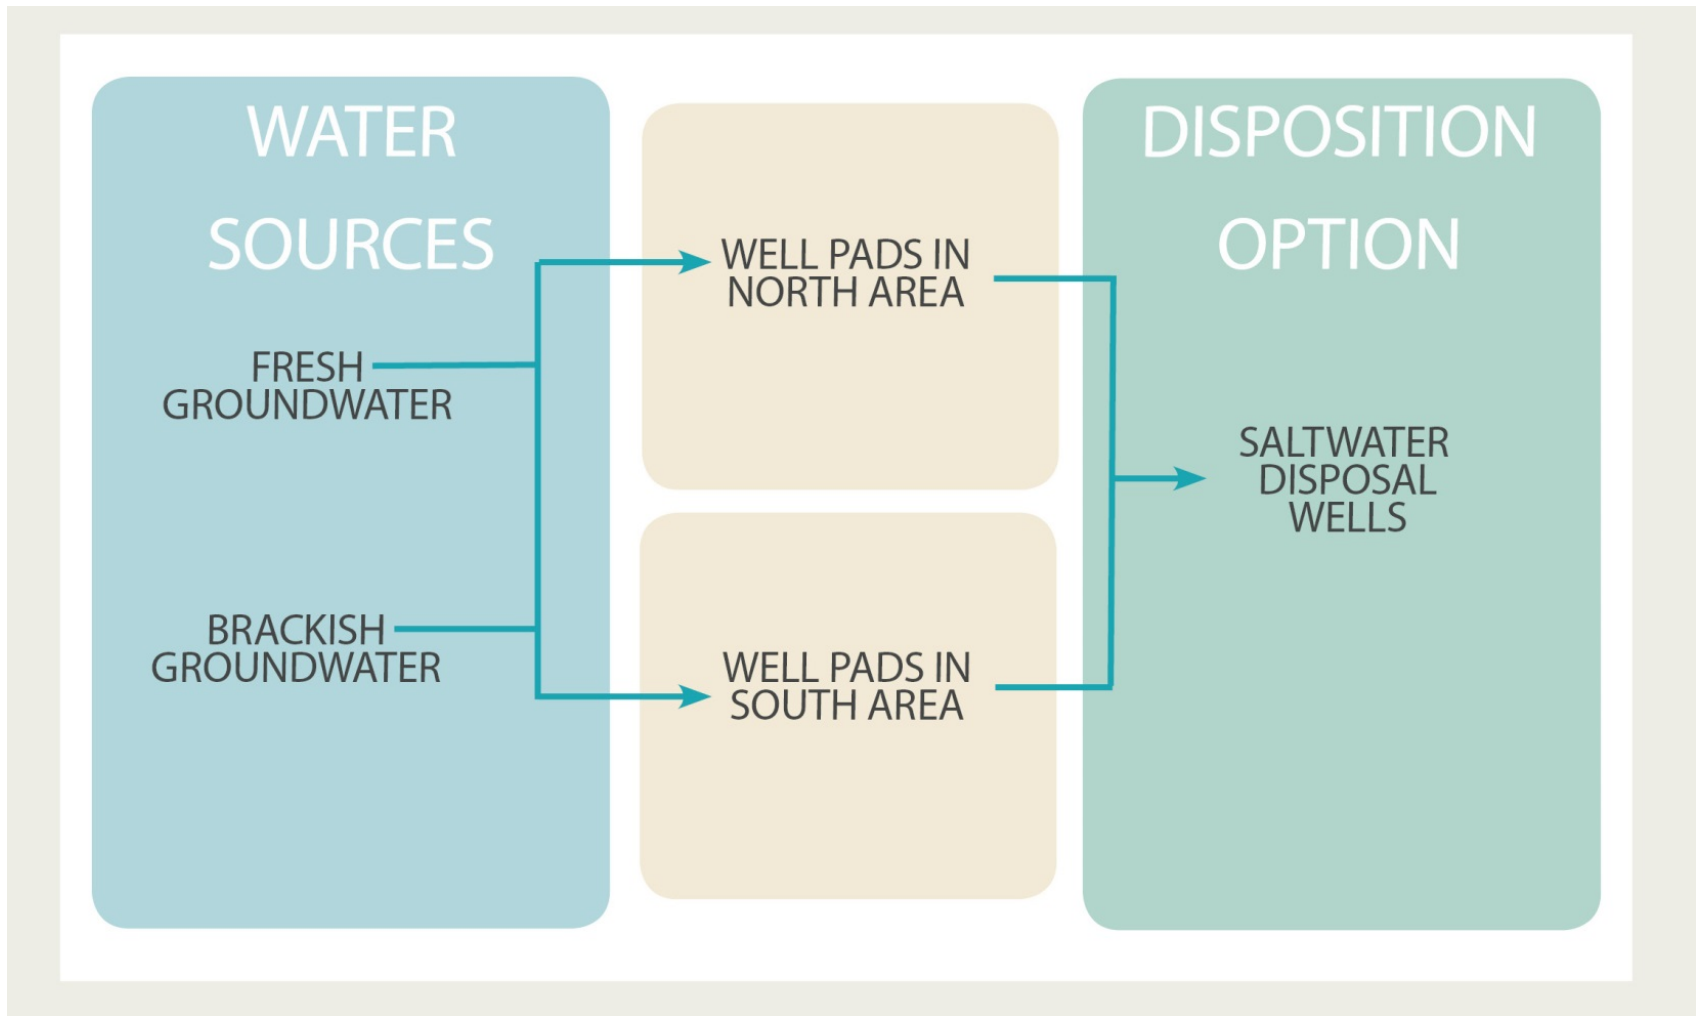

Scenario 1: Trucking, no storage, no reuse

Scenario 2: Trucking, no storage, reuse

Scenario 5: Trucking, centralized source water storage, reuse

Run Water Planning Scenario: Sourcing and Disposition

Run Logistics Options: Transportation and Storage

Create Supply, Demand and Produced Water Projections

Summarize and Evaluate Options Analyses Results

Water Sourcing Summary

Simulation Period: 12/1/2012 – 1/1/2017

Parameter	Water Management Scenario				
	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5
Cumulative Source Water Used (bbl)	5,701,179	2,843,197	2,829,588	5,969,179	3,034,024
Cumulative Source Water Cost (\$)	23,951,190	29,280,511	29,857,225	24,852,280	31,340,313
Unit Source Water Cost (\$/bbl)	4.20	10.30	10.55	4.16	10.33
Cumulative Insufficient Source Water Capacity (bbl)	(178,464)	(22,186)	(22,186)	(26,964)	0

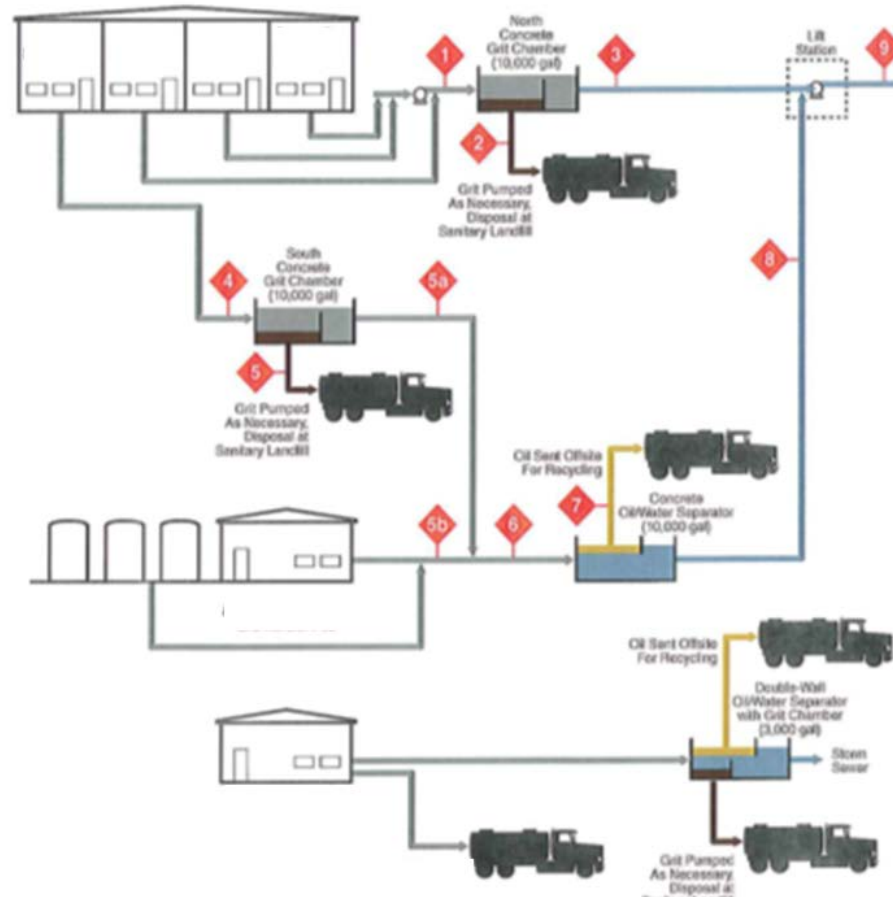

Water Sourcing Summary

Parameter	Scenario 1
Cumulative Source Water Used (bbl)	5,701,179
Cumulative Source Water Cost (\$)	23,951,190
Unit Source Water Cost (\$/bbl)	4.20
Cumulative Insufficient Source Water Capacity (bbl)	(178,464)

Using Sustainability Analysis to Select and Optimize Water Treatment Alternatives

Example: Industrial Facility Expansion

Scope and Objectives

Objectives:

- Capture and treat of all sources of industrial wastewater from maintenance and fueling operations
- Comply with discharge regulations
- Identify the most sustainable technology
- Meet stakeholder expectations

Stakeholders:

- Regulators
- Neighbors
- Local community

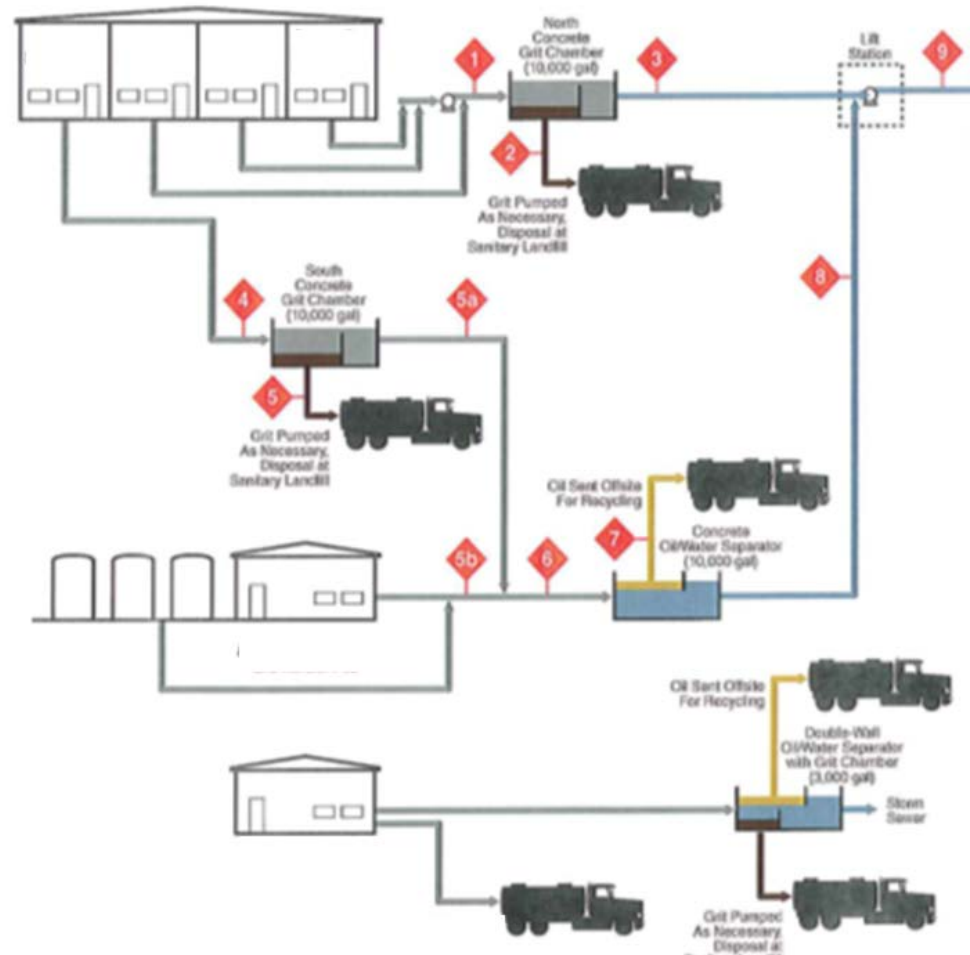

Evaluating Sustainability of Water Treatment Options

Wastewater Inflow:

- Average flow: 60 gpm with 100 gpm peaks
- Oil and grease, 700 mg/L

Discharge Requirements

- Oil and grease, < 60 mg/L

Benefits of a Multi-Criteria Sustainability Analysis

Characteristic	Benefit
<i>Collaborative</i>	Provide a framework to engage and solicit input from various parties involved in the decision
<i>Holistic</i>	Incorporate goals important to the organization and its external stakeholders (technical and non-technical; short- and long-term)
<i>Transparent & Traceable</i>	Document supporting information and reasoning behind the decision Facilitate communication within the organization and with external stakeholders
<i>Adaptive</i>	Assure continuity and ability to incorporate new information
<i>Defendable</i>	Inform decision based on an explicit understanding of the strengths, weaknesses and tradeoffs among alternatives

5 –Step Evaluation Process

A 5-Step Evaluation Process

Environmental Aspect						
Code	Indicator	OPTION 1	OPTION 2	OPTION 3	Weight	
ENV-1	Are offset gains additional to future trajectory based on status quo?	50	100	50	3	
ENV-2	Can the offset site be expanded upon, or, the method intensified, to incorporate future offsets?	150	50	100	2	
ENV-3	Complimentarity of offset with regional conservation goals.	50	100	0	1	
ENV-4	Does the offset site create the opportunity for buffering of important site(s), or, to enhance connectivity in landscape?	50	100	50	2	
ENV-5	Ratio of impact footprint area versus area required for>NNL offset . (= 'offset efficiency').	25	50	25	1	
ENV-6	Offset enhancement technology performance risk.	100	100	50	2	
Social Aspect						
Economic Aspect

Step 1 - Project Description : Conceptualization of the site conditions

Project Objectives and Constraints

Project Objective

B I U x_2 x^2

ABC is conducting a major expansion/renovation of their facility to include an operation that would perform maintenance on cars and large scale fueling activities. ABC's objective is to accomplish the efficient capture and treatment of all sources of industrial waste water (a total of 7 separate sources have been identified at this time) and to maintain compliance with all requirements for these operations.

Save

Input Water Characteristics

B I U x_2 x^2

Average combined flows of approximately 60 gallons per minute (gpm) and peak flows of 100 gpm are anticipated for the proposed operations. The industrial waste water is expected to contain grit solids, oil and grease.

Save

Discharge Point(s)

Step 2 - Option Development

Option	Name	Status	Actions
1	<input type="text" value="Coalescing Filter"/>	<input type="text" value="Selected"/>	

Option Description

General description of the approach versus objective(s)

Provide a general description of the approach and explain how the approach will meet the project objective(s):

The coalescing filter will be used as part of a treatment train (described below) for water coming from the fueling service area, the diesel fueling area, and the fuel

Is the proposed approach expected to meet the objectives ?

Yes

Description of technology

Technology

Provide a summary of the technology and explain how the technology will meet physical site constraints if any :

The treatment train will be : - equalization tank- oil-water separator (oil to off-site recycling)- Bag filters to 10um- coalescing filters

Additional Testing Required

Select Target Indicators

Step 3a - Indicator Selection

New Indicator

Import Indicator

Environmental Aspect

Selection	Theme	Indicator	Description
<input checked="" type="checkbox"/>	Water Use (inputs to the system)	Potable water use	 
<input checked="" type="checkbox"/> 	Energy (inputs to the system)	Energy consumption/generation

Detailed Results for Optimization

Sustainable Water Management Planning Benefits

- Provides a risk-based approach for comparing alternative water management scenarios and answering “what if” questions
 - Viability of sources
 - Most cost effective logistics
 - Water treatment needs
 - Reuse/disposal evaluation
 - Impact of regulatory changes
- Communicates the decision-making process to stakeholders
- Optimizes planning, design and negotiations
