Concept & Implementation

**Responsible Development**  
An Established Principle

## **Water Management Plan**

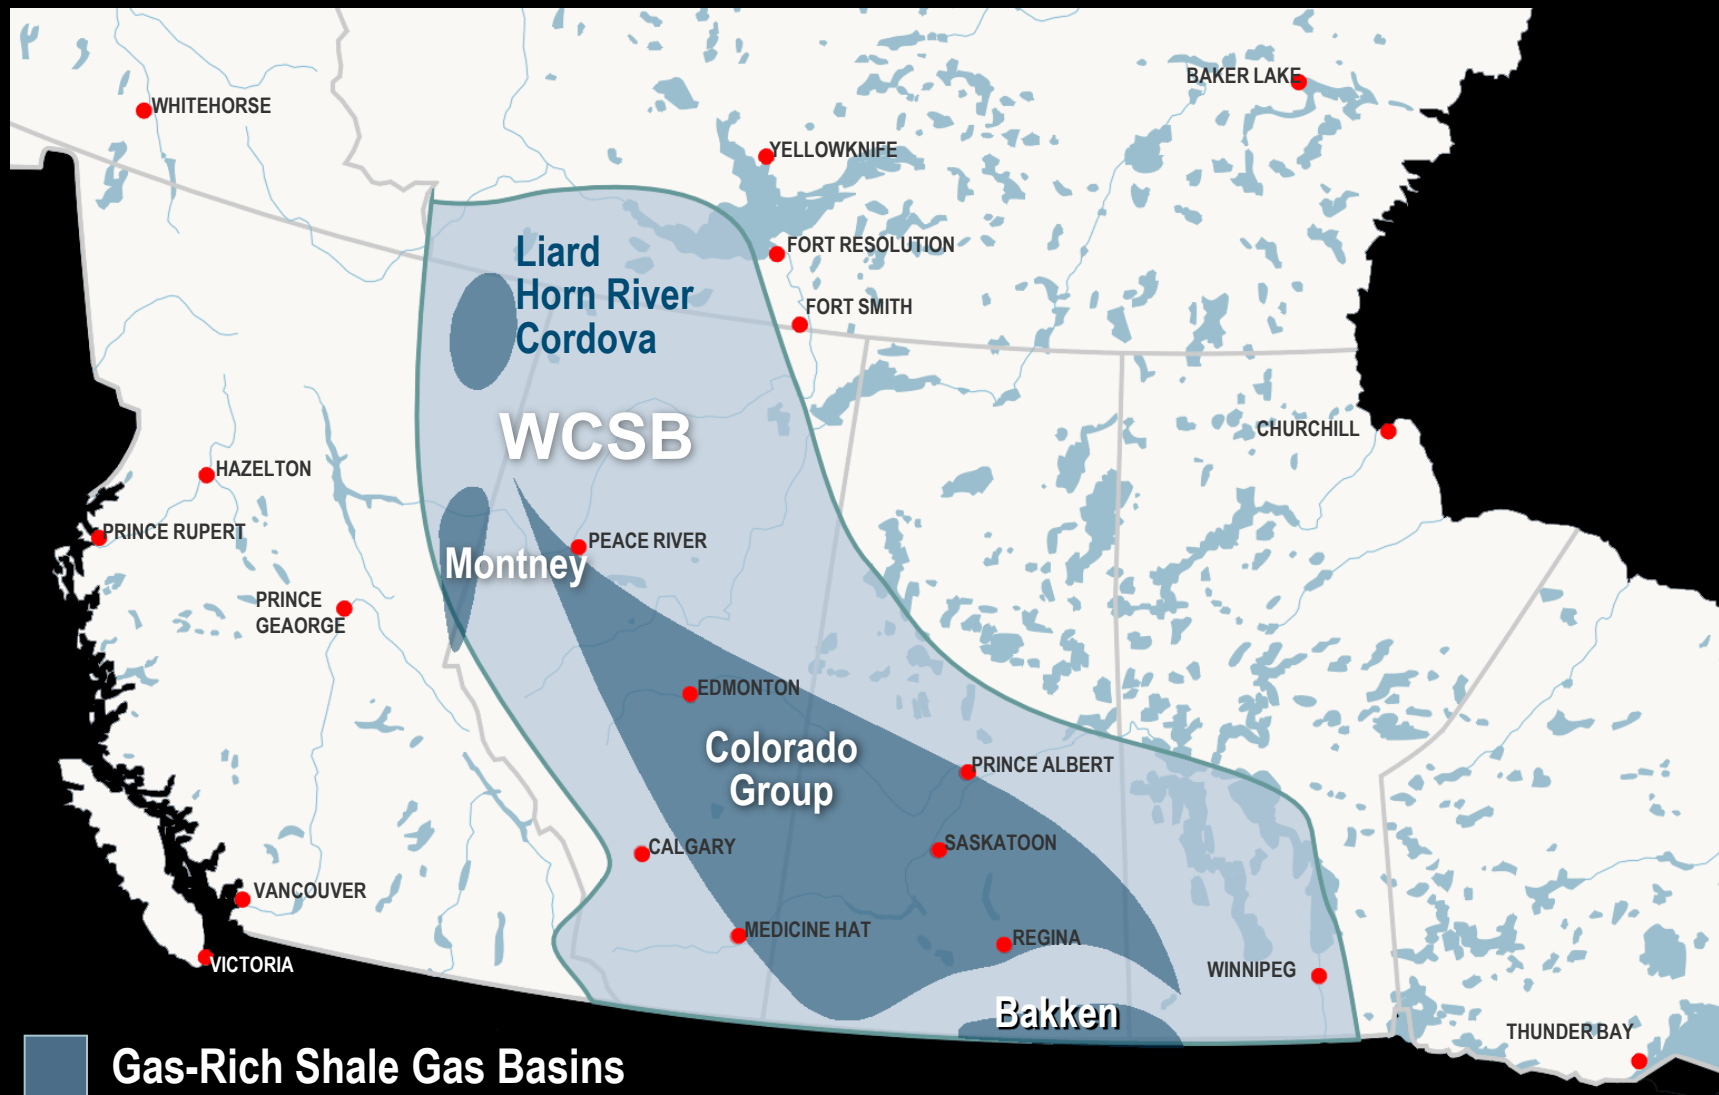

**Dilly Creek Lease • Horn River Basin • NE British Columbia**

April, 2012

AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# WESTERN CANADIAN SEDIMENTARY BASIN

## AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# THE NATURE OF SHALE

- Dense: derived from clay and mud
- Layers deposited over 500MM years
- Organic material trapped between layers
- In deep formations, heat and pressure breaks down the organics into oil and natural gas
- Some of the gas migrates out of the shale and congregates in discrete pools or above oil (conventional gas)
- The rest of the gas is adsorbed i.e. coats the surfaces of the shale or, it is trapped in sand between layers

## AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# SHALE GAS - THE HISTORICAL VIEW

- Until ten years ago, shale gas was largely ignored
- Vertical drilling penetrated shale beds on the way to conventional oil and gas deposits
- The exposed surface area was never great enough to produce gas in commercial volumes

## AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# CONVENTIONAL HYDRAULIC FRACTURING

- Hydraulic fracturing or 'fracking' was first used to recover natural gas and oil in 1947
- Conventional hydraulic fracturing which, typically consumes 75,000 to 300,000 litres of fluid per well, has been used over the years to stimulate high-permeability conventional reservoirs

## AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# HORIZONTAL DRILLING

- **1920's** Wells were deviating from vertical and resulting in lawsuits
- **1930** Sun Oil contracted the Sperry Corporation to modify small gyroscopic compasses to guide directional drilling
- **1940's & 1950's** 'Bottom Hole Assembly' (BHA) drilling equipment was developed
- These gyro and BHA tools made directional drilling possible
- **1970** Downhole drilling motors propelled by 'mud' were developed
- Directional wells were first used to drill relief wells for 'blowouts'

AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# SHALE HYDRAULIC FRACTURING

Horizontal Drilling

Cement & Casing

Perforation

Hydrofracking

# SHALE HYDRAULIC FRACTURING - INNOVATION

## MULTI-STAGE FRACKING

- In multi-stage fracking, a portion of the horizontal well bore is fracked and then, this section is isolated with a cement plug and another section is fracked continuing the process right back to the vertical well bore
- Once fracking is complete, the cement plugs are drilled out to allow the gas to escape
- This method of multi-stage fracking was first used in the late 1990s in the Barnett Shale Bed in Texas

# SHALE GAS - RISE TO PROMINENCE

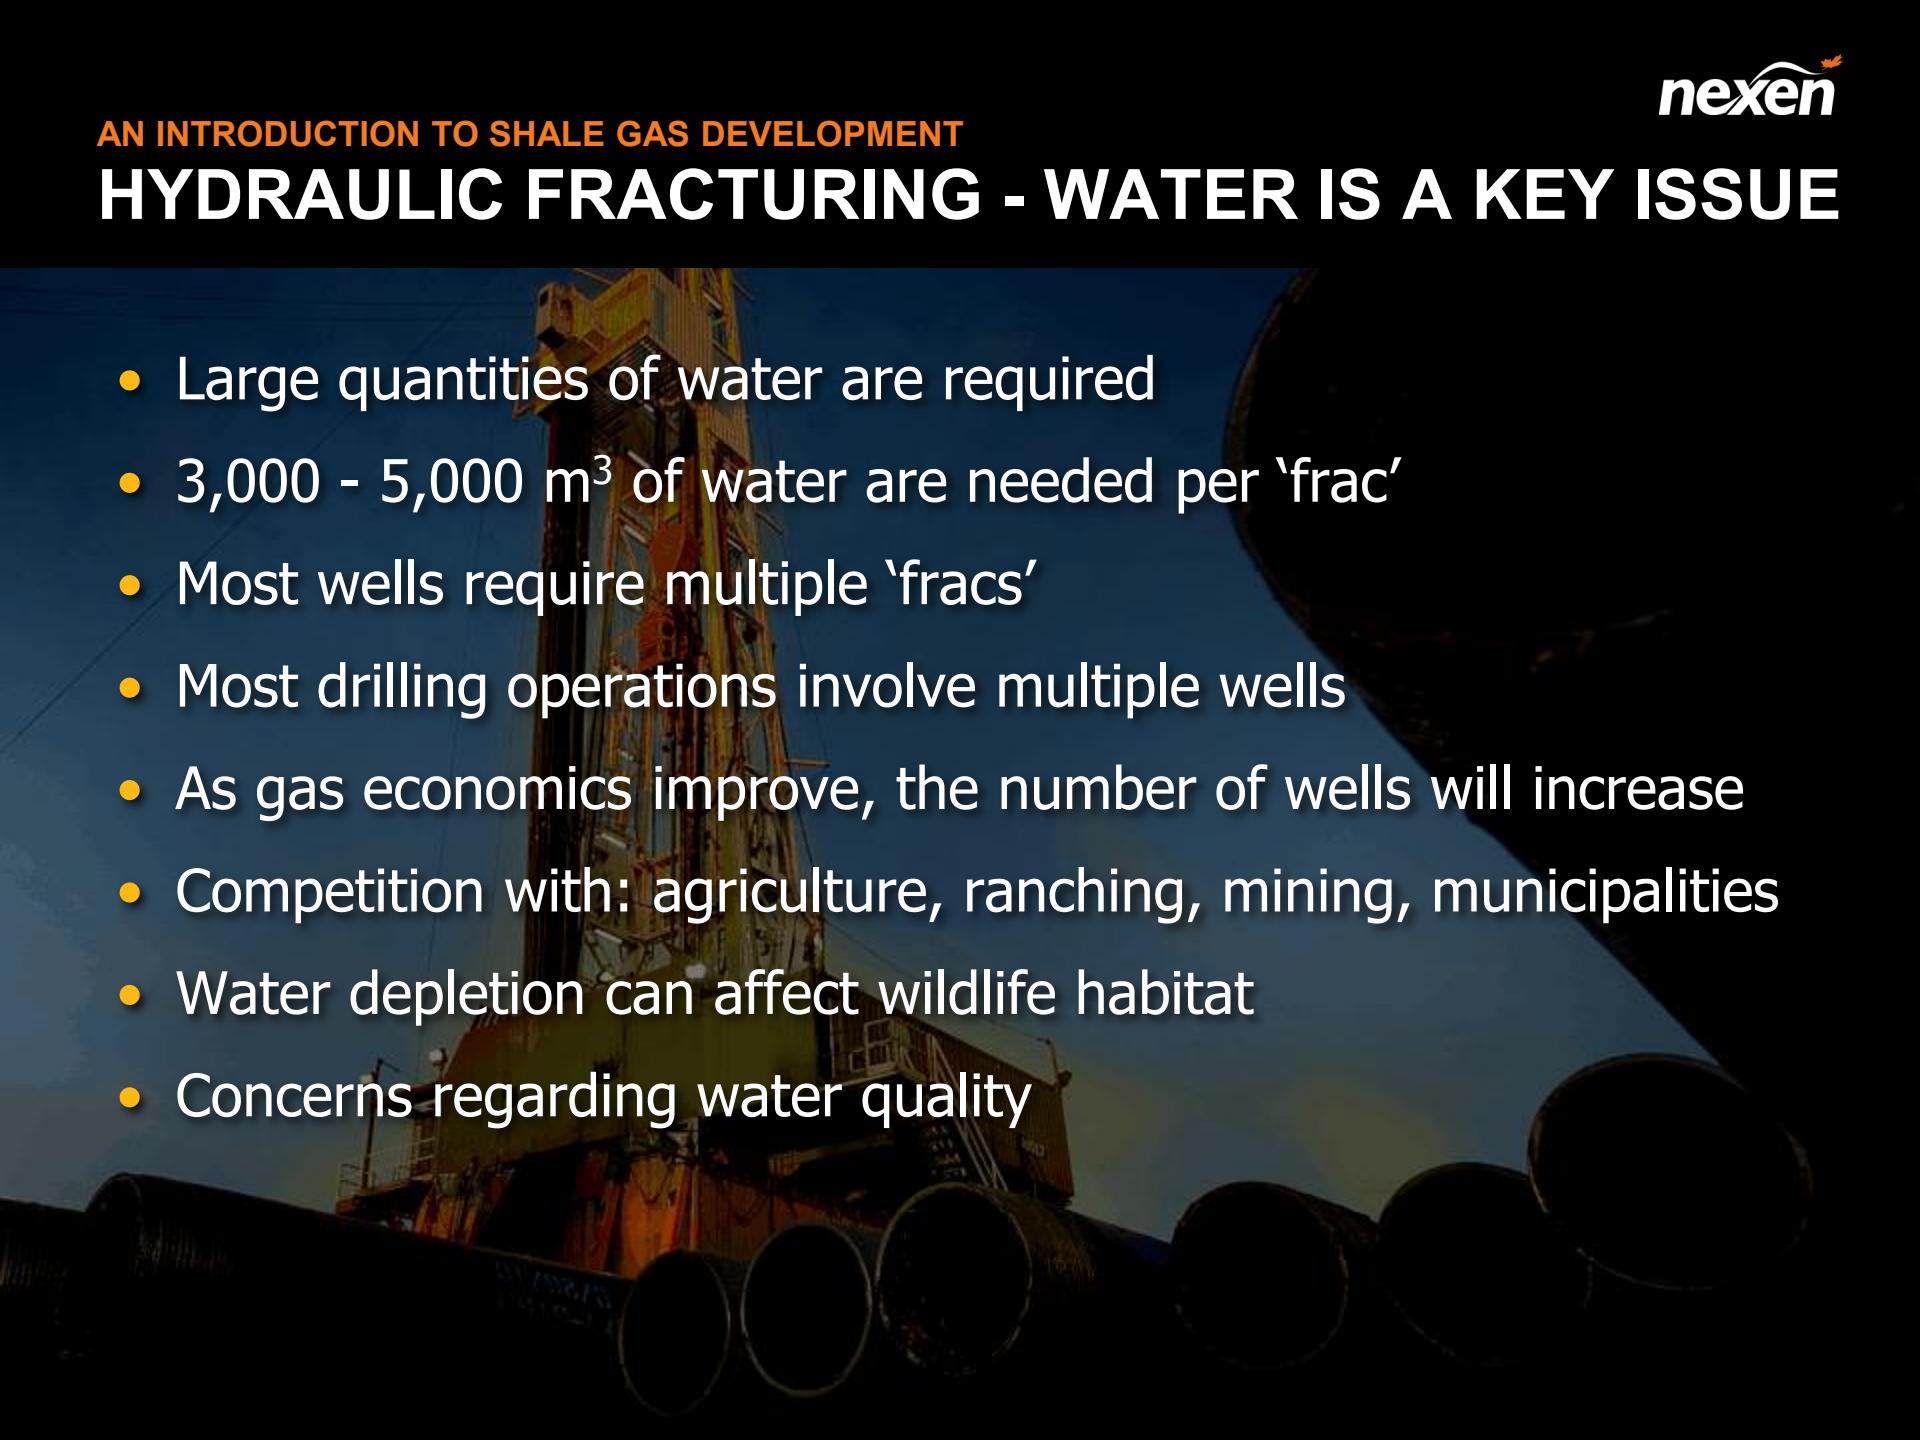

## RISE TO PROMINENCE

- Commercially viable due to horizontal drilling and multi-stage fracking
- Outstanding success in the United States
- Wide-spread publicity
- Responsible for the U.S. 100-year supply of natural gas
- Major contribution to energy independence in the U.S.

## IMPORTANCE

- In Canada, 40% of conventional gas has been produced
- Large reserves make it a viable replacement supply for the future
- Has the potential for a new industry, job creation and economic stimulus
- Represents a new source of revenue for Government
- Opens up the potential for new international markets and trade

# HYDRAULIC FRACTURING - WATER IS A KEY ISSUE

- 
- Large quantities of water are required
  - 3,000 - 5,000 m<sup>3</sup> of water are needed per 'frac'
  - Most wells require multiple 'fracs'
  - Most drilling operations involve multiple wells
  - As gas economics improve, the number of wells will increase
  - Competition with: agriculture, ranching, mining, municipalities
  - Water depletion can affect wildlife habitat
  - Concerns regarding water quality

AN INTRODUCTION TO SHALE GAS DEVELOPMENT

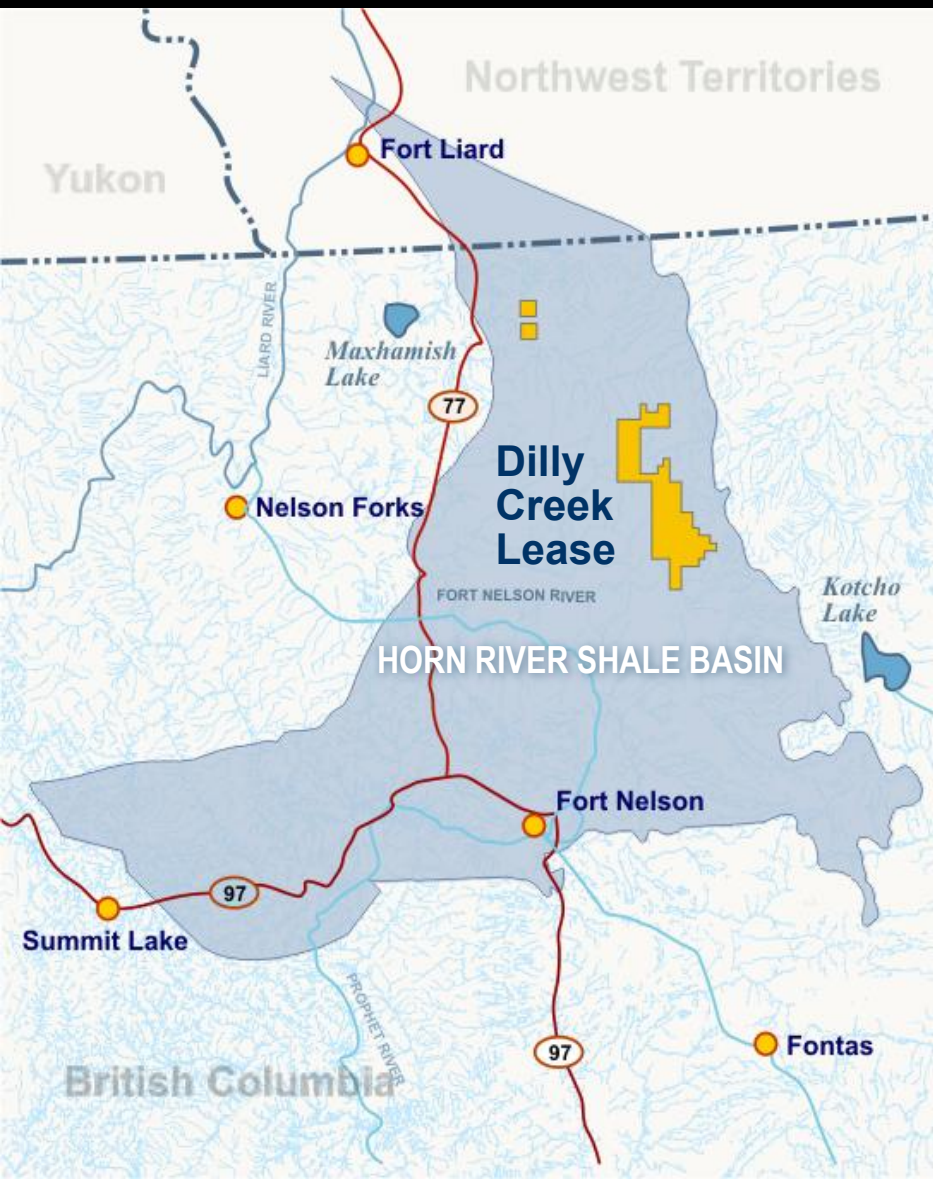

# NEXEN'S HORN RIVER SHALE GAS PROJECT

## AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# NEXEN'S SHALE GAS STRATEGY

- The NE B.C. Leases are considered long-term assets
- A resource for the future
- Establish a strong land position
- Develop these leases at a measured pace
- Gear the pace of development to: gas demand, gas price, new markets and return-on-investment
- Develop an efficient, cost-effective method of production
- Invest in new technologies

AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# HORN RIVER DEVELOPMENT TO DATE

- Development began in 2007
- Production began in 2009
- Currently working with a short-term water permit
- 24 wells drilled and completed
- 18 wells to be completed July 2012
- 10 wells scheduled to drill in 2012
- Etsho North Gas Plant upgrade completed in 2011
- Tsea Gas Plant scheduled to be on-stream by the end of 2012 ( 150MMCF/D raw )

AN INTRODUCTION TO SHALE GAS DEVELOPMENT

# SEASONAL NATURE OF HORN RIVER ACTIVITY

A high-speed photograph of water splashing upwards, creating a dynamic and energetic background. The water is captured in mid-air, with numerous droplets and bubbles visible, giving it a sense of movement and freshness. The background is a gradient of light blue and white, enhancing the clarity of the water splash.

An Introduction

# Water Management Plan

Concept & Implementation

Responsible Development  
Conforming to Policy

## Water Management Plan

**Dilly Creek Lease • Horn River Basin • NE British Columbia**

April, 2012

# WATER MANAGEMENT PLAN

# NEXEN'S WATER MANAGEMENT STRATEGY

- Obey the law
- Manage Responsibly
- Think Long-Term
- Consult with Stakeholders
- Create and Maintain a Water Management Plan
- Publish Performance Results
- Invest in New Technology
- Reduce Fresh Water Use
- Safe Disposal of Frac Fluid

# HORN RIVER – ESTIMATED WATER NEED

- 1 pad /year
- 20 wells /pad
- 20 fracs /well
- 3,000-5,000 m<sup>3</sup> of water /frac
- 60,000-100,000 m<sup>3</sup> of water /well
- 1.2 million m<sup>3</sup> to 2.0 million m<sup>3</sup> of water/year

# WATER MANAGEMENT PLAN

## POSSIBLE SOURCES OF WATER

**Surface  
Water**

**Recycled  
Frack Water**

**Municipal  
Waste Water**

**Trucked  
Water**

**Deep Aquifer  
Saline Water**

# WATER MANAGEMENT PLAN

## SOURCES OF WATER CONSIDERED

Surface  
Water

Recovered  
Frack Water

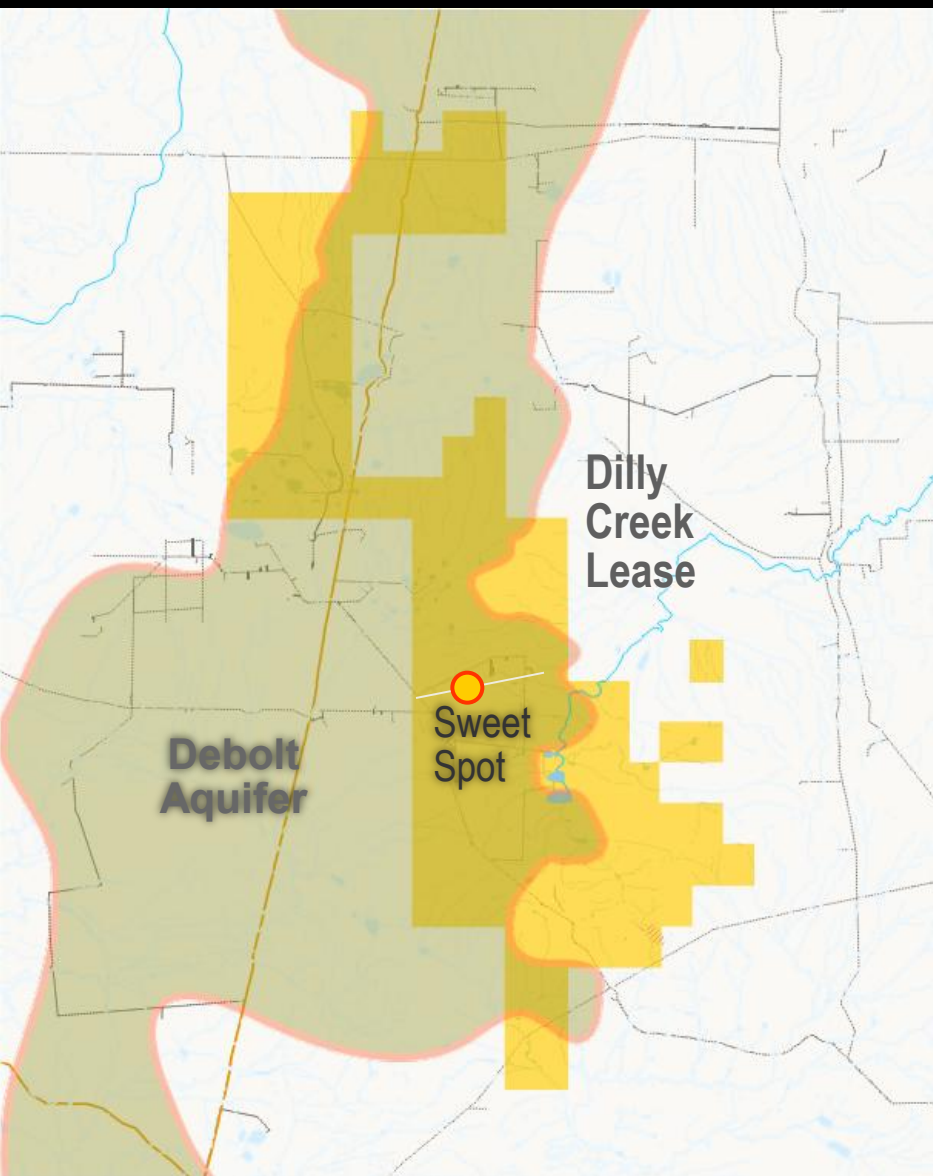

Deep Aquifer  
Saline Water

# THE DEBOLT DEEP SALINE AQUIFER

# THE DEBOLT AQUIFER - A VIABLE OPTION

- The aquifer runs under the Dilly Creek Lease
- The top of the aquifer is 645 m below the surface
- Total thickness: 83 meters
- Estimated porosity over the current wells: 35%
- Reservoir pressure: 4,550 kPa or ~6.4 kPa/meter
- The 'sweet spot' is in a highly porous area - an advantage not found throughout the Basin
- **Need a solution to the H<sub>2</sub>S problem before the option is feasible**

# DEBOLT WATER - THE PROBLEM

Lethal Hydrogen Sulfide Gas

- Too salty to drink
- Salt water containing  $\sim 22,000$  TDS ( total dissolved solids )
- Sea water is  $\sim 35,000$  TDS
- Heavy to pump
- Gas:Water Ratio:  $1.35 \text{ m}^3/\text{m}^3$
- Gas content: 57% methane ( $\text{C}_1$ ), 42% carbon dioxide ( $\text{CO}_2$ ) and 0.5% hydrogen sulfide ( $\text{H}_2\text{S}$ )
- $\text{H}_2\text{S}$  gas is lethal
- $\text{H}_2\text{S}$  dissolved at reservoir pressure
- Atmospheric pressure is less than the gas 'bubble point' therefore, in air, Debolt water releases  $\text{H}_2\text{S}$  gas

# DEBOLT WATER - POTENTIAL SOLUTIONS

## OPTIONS

- 1. TREAT TO FRAC SPEC** i.e. remove the  $H_2S$   
Encana & Apache used this method at their Two Island Lake Plant  
It is a very expensive approach ( est. \$87MM in Capital + OPEX )
- 2. TREAT TO POTABLE SPEC** i.e. remove the  $H_2S$  and dissolved solids.  
To date, this is unproven technology with field trials underway  
Frac water can be treated to a lower standard if used again for fracking  
( est. cost of \$3-\$5/m<sup>3</sup> of water treated and it is also energy intensive )
- 3. PRESSURIZED FRAC ON DEMAND (PFOD)** A Closed Loop System  
i.e. keep the Debolt water in its raw state, at formation pressure,  
unexposed to the atmosphere and dispose of returned frac fluid to the  
Debolt aquifer after use

## PERMISSION TO USE WATER IN B.C.

### Short-term Water Permits

Oil & Gas Commission  
Regulatory Body

- Permits may be suspended during B.C. droughts
- Less security for planning purposes
- Permits issued annually
- Regulating multi-users is difficult

---

### Water License

B.C. Ministry of Forests, Lands &  
Natural Resource Operations  
( FLNRO )  
B.C. Water Stewardship Branch

- Proposal based on real-time monitoring of water availability
- Reduces the need to draw water in periods of naturally low flow
- Enhances long-term security of water supply
- Increases certainty of annual water allocation

# NEXEN'S DECISION CONCERNING PERMISSION

## Short-term

### Short-term Water Permit

( B.C. Oil & Gas Commission )

- Applied for annually since 2009
- Currently operate on this basis

---

## Long-Term

### Water License

( B.C. Ministry of Forests, Lands & Natural  
Resource Operations ( FLNRO ) )

- Application submitted in 2009
- A unique, adaptive **Water Management Plan** to govern the license was submitted in 2011

# WATER MANAGEMENT PLAN

## TIMELINE

2009

### GETTING TO KNOW THE TSEA LAKES

- Establish a site-specific data base
- Collect data for baselines for on-going impact monitoring

2010

### GETTING A HANDLE ON A CONCEPT

- Identify a characteristic hydrologic profile
- Develop a concept for The Water Management Plan

2011

### STRUCTURING & SUBMITTING THE PLAN

- Develop the rationale for The Water Management Plan
- Structure, quantify and submit The Plan to FLNRO

2012

### COMMITTING THE PLAN TO PRACTICE

- Commit all aspects of The Plan to practice in anticipation of a license
- Refine and enhance monitoring capabilities

# WATER MANAGEMENT PLAN

2009 FIELD WORK

A photograph of a sunset over a calm lake. The sun is a bright, glowing orb on the right side of the horizon, with its light reflecting on the water's surface. The sky is filled with dark, textured clouds, some of which are illuminated by the sun's light. The far shore of the lake is visible as a dark silhouette of trees. In the foreground, the dark, silhouetted branches of a tree are visible on the right side.

*Getting to Know the Tsea Lakes*

# 2009 FIELD WORK - OBJECTIVES

- Establish a site-specific data base
- Document the as-found conditions to create a baseline for monitoring impacts
- Determine the size of the catchment area that feeds the Tsea lakes
- Refine the understanding of seasonal changes suggested by regional data
- Identify animal species that depend on the Tsea River

# WATER MANAGEMENT PLAN

## 2009 FIELD WORK - IMPACT BASELINE DATA

**WATER  
QUALITY**

**FISH HABITAT  
UPSTREAM**

**DOWNSTREAM  
COMMUNITIES**

**TRUMPETER  
SWANS**

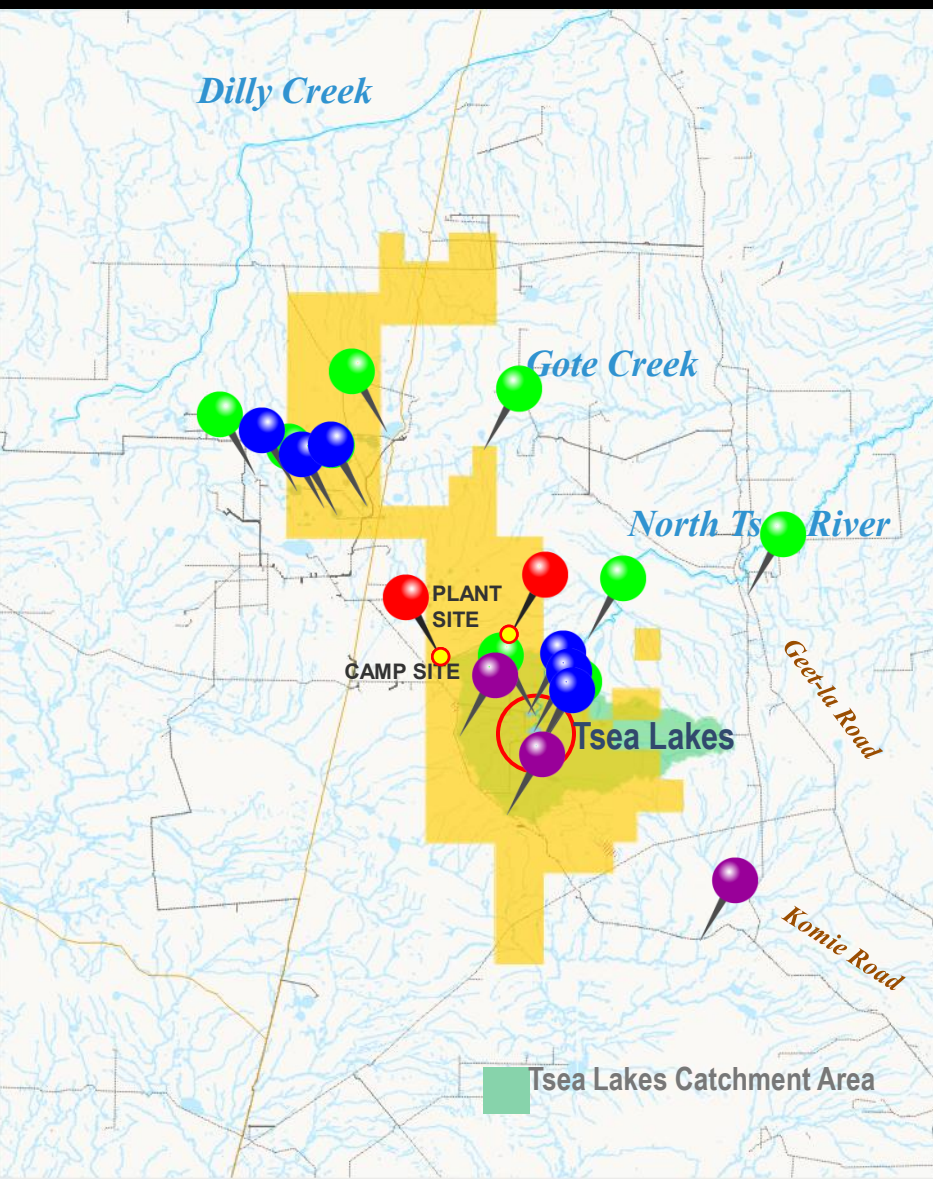

**FISH HABITAT  
DOWNSTREAM**

**WOODLAND  
CARIBOU**

# 2009 FIELD WORK - DATA COLLECTION

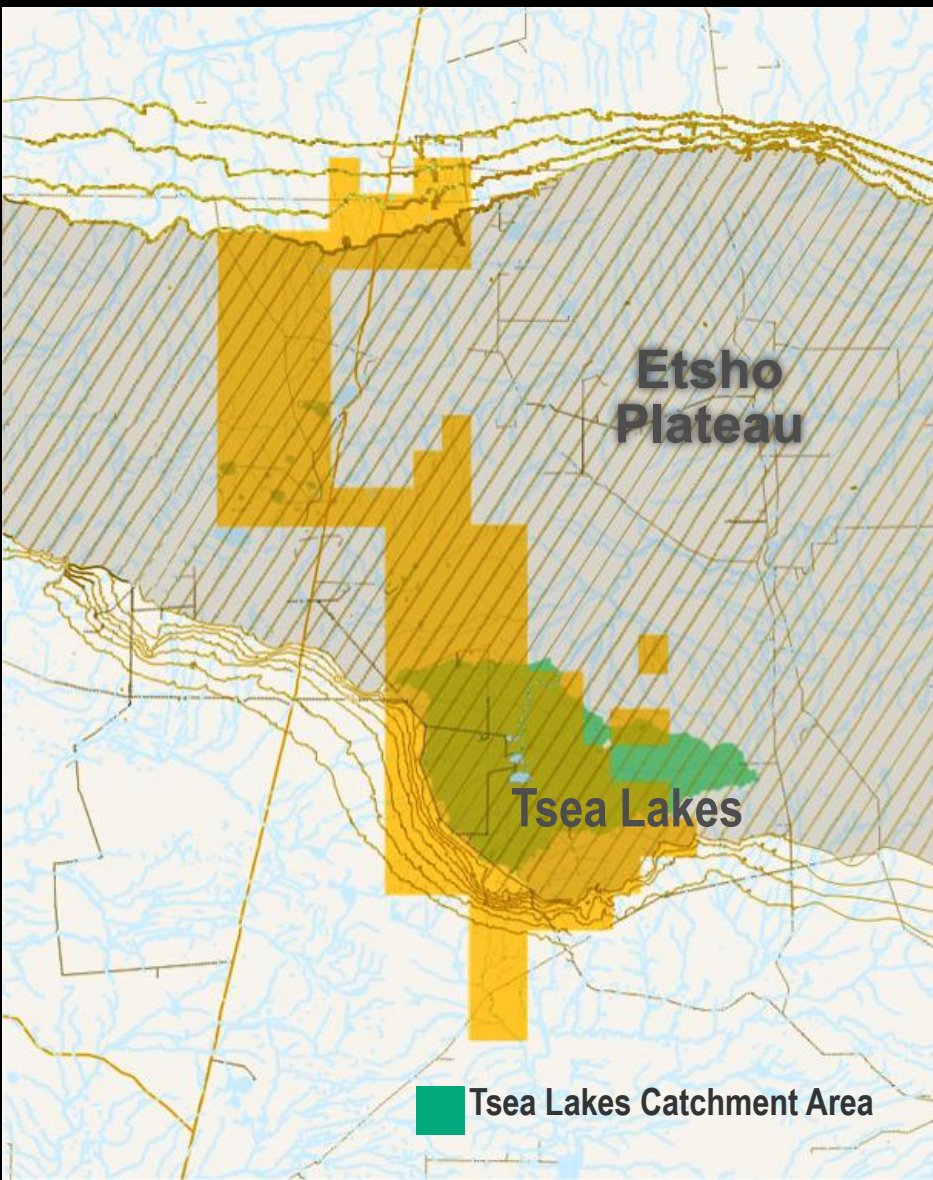

-  Precipitation
  -  Stream water levels and discharge
  -  Lake water levels and bathymetry ( depth/volume )
  -  Snow course
- An effort to confirm the amount of water in the system
  - Establishing data collection points
  - Collecting site data for comparison with regional data

# 2009 FIELD WORK FINDINGS - DISCHARGE

Mean Daily Discharge (  $\text{m}^3/\text{sec}$  ) TSEA RIVER VS. REGIONAL DISCHARGE

# THE ETSHO ESCARPMENT & PLATEAU

- Approximately 340 meter increase in elevation
- An expected, corresponding increase in precipitation
- The discharge from Tsea Lakes is expected to be greater than the regional data suggests

# WATER MANAGEMENT PLAN

2010 FIELD WORK

*Getting a Handle on a Concept*

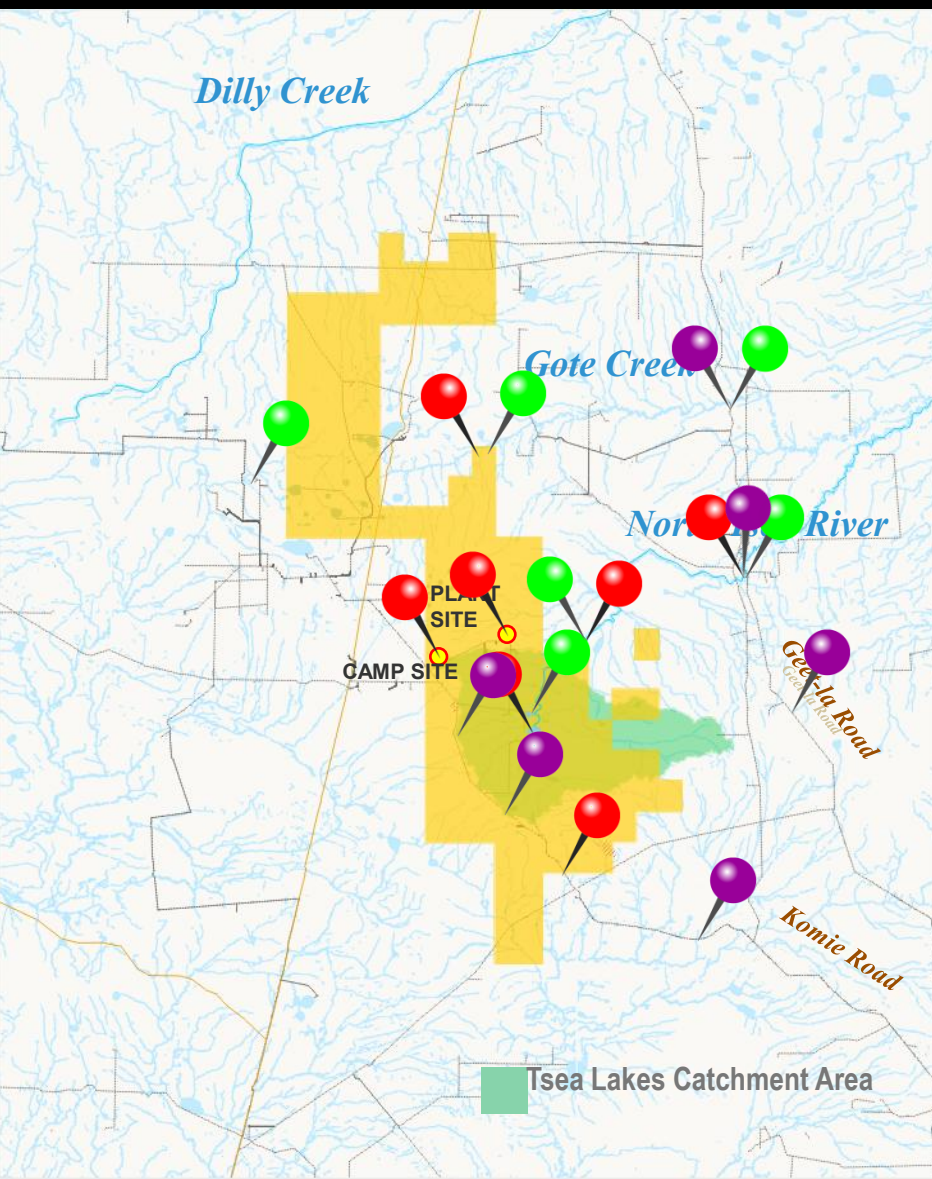

# 2010 FIELD WORK - OBJECTIVES

- Identify the natural cycle of discharge from the Tsea Lakes and the Tsea River i.e. the timing of the peaks and the lows
- Understand how precipitation effects flow levels
- Test the assumptions concerning amount of water available made in 2009 on the basis of regional data
- Examine all of the data with a view to defining a concept for The Water Management Plan

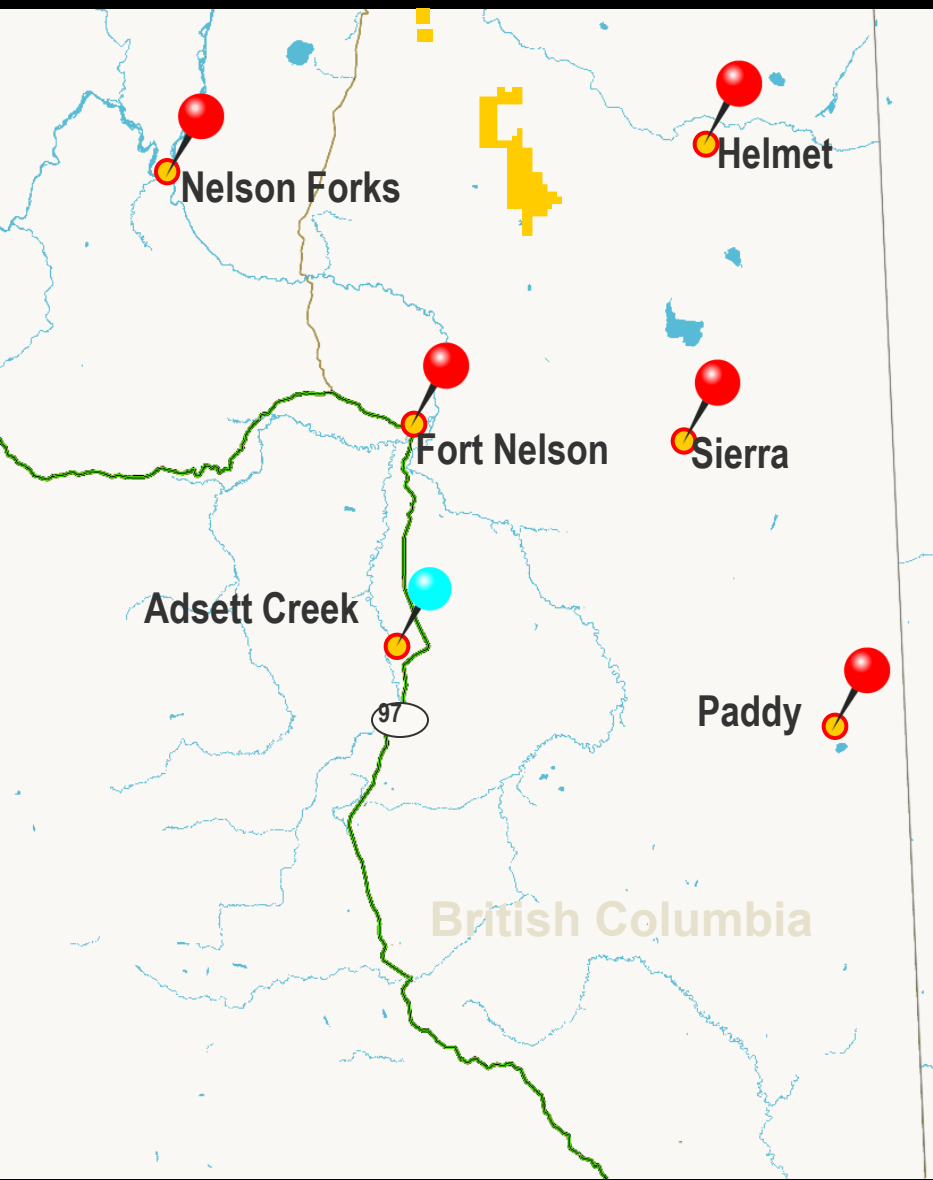

# 2010 FIELD WORK - DATA COLLECTION

- Precipitation
  - Stream water levels and discharge
  - Snow course
  - Regional Stream Flow Stations
- Snow course sampling on and off the plateau
  - Refined and expanded water level and water discharge sites

# 2010 FIELD WORK - REGIONAL DATA

-  **Precipitation**
-  Stream water levels and discharge
-  Snow course
-  **Regional Stream Flow Stations**

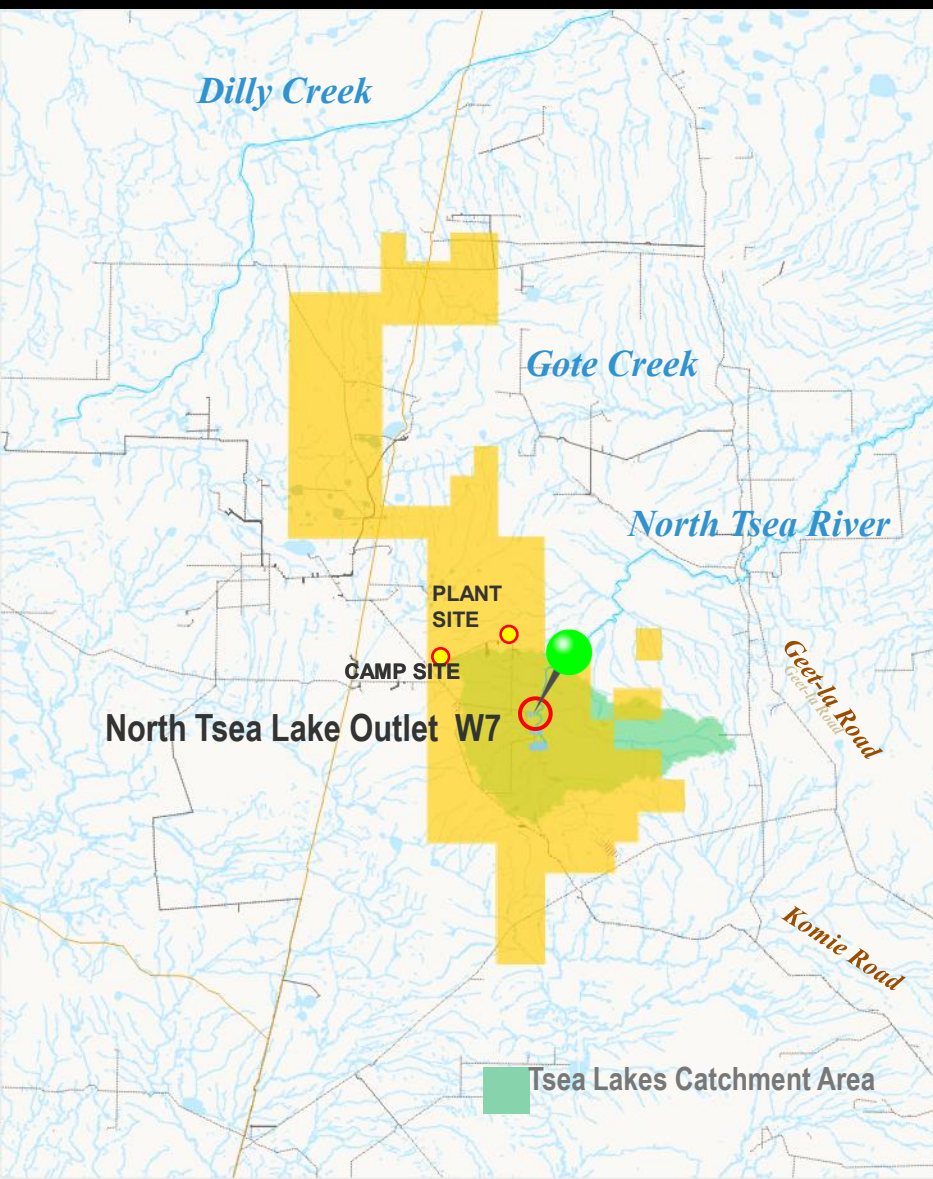

- Current data from the regional stations operated by the federal and provincial governments was compared to the data collected

# 2010 FIELD WORK FINDINGS - DISCHARGE

Mean Daily Discharge (  $\text{m}^3/\text{sec}$  ) TSEA RIVER VS. REGIONAL DISCHARGE

# 2010 FIELD WORK - NORTH TSEA LAKE AT W7

- Precipitation
- Stream water levels and discharge
- Regional Stream Flow Stations

# 2010 FIELD WORK - CHARACTERISTIC CURVE

Mean Daily Discharge ( m<sup>3</sup>/sec ) TSEA RIVER AT W7- NORTH TSEA LAKE OUTLET

# 2010 FIELD WORK - CHARACTERISTIC CURVE

Mean Daily Discharge (  $\text{m}^3/\text{sec}$  ) TSEA RIVER AT W7- NORTH TSEA LAKE OUTLET

# CONCEPT

## SUPPLY

## DRAW

Flow Conditions ( m <sup>3</sup> /sec)		Licensed Withdrawal
Excessive Discharge Stage	➡	XX% of Daily Discharge
Robust Discharge Stage	➡	XX% of Daily Discharge
Moderate Discharge Stage	➡	XX% of Daily Discharge
Low Discharge Stage	➡	No Withdrawal
Annual Withdrawal Limit	➡	X,XXX,XXX m <sup>3</sup> /year

# 2011 FIELD WORK WATER MANAGEMENT PLAN

*Structuring & Submitting the Plan*

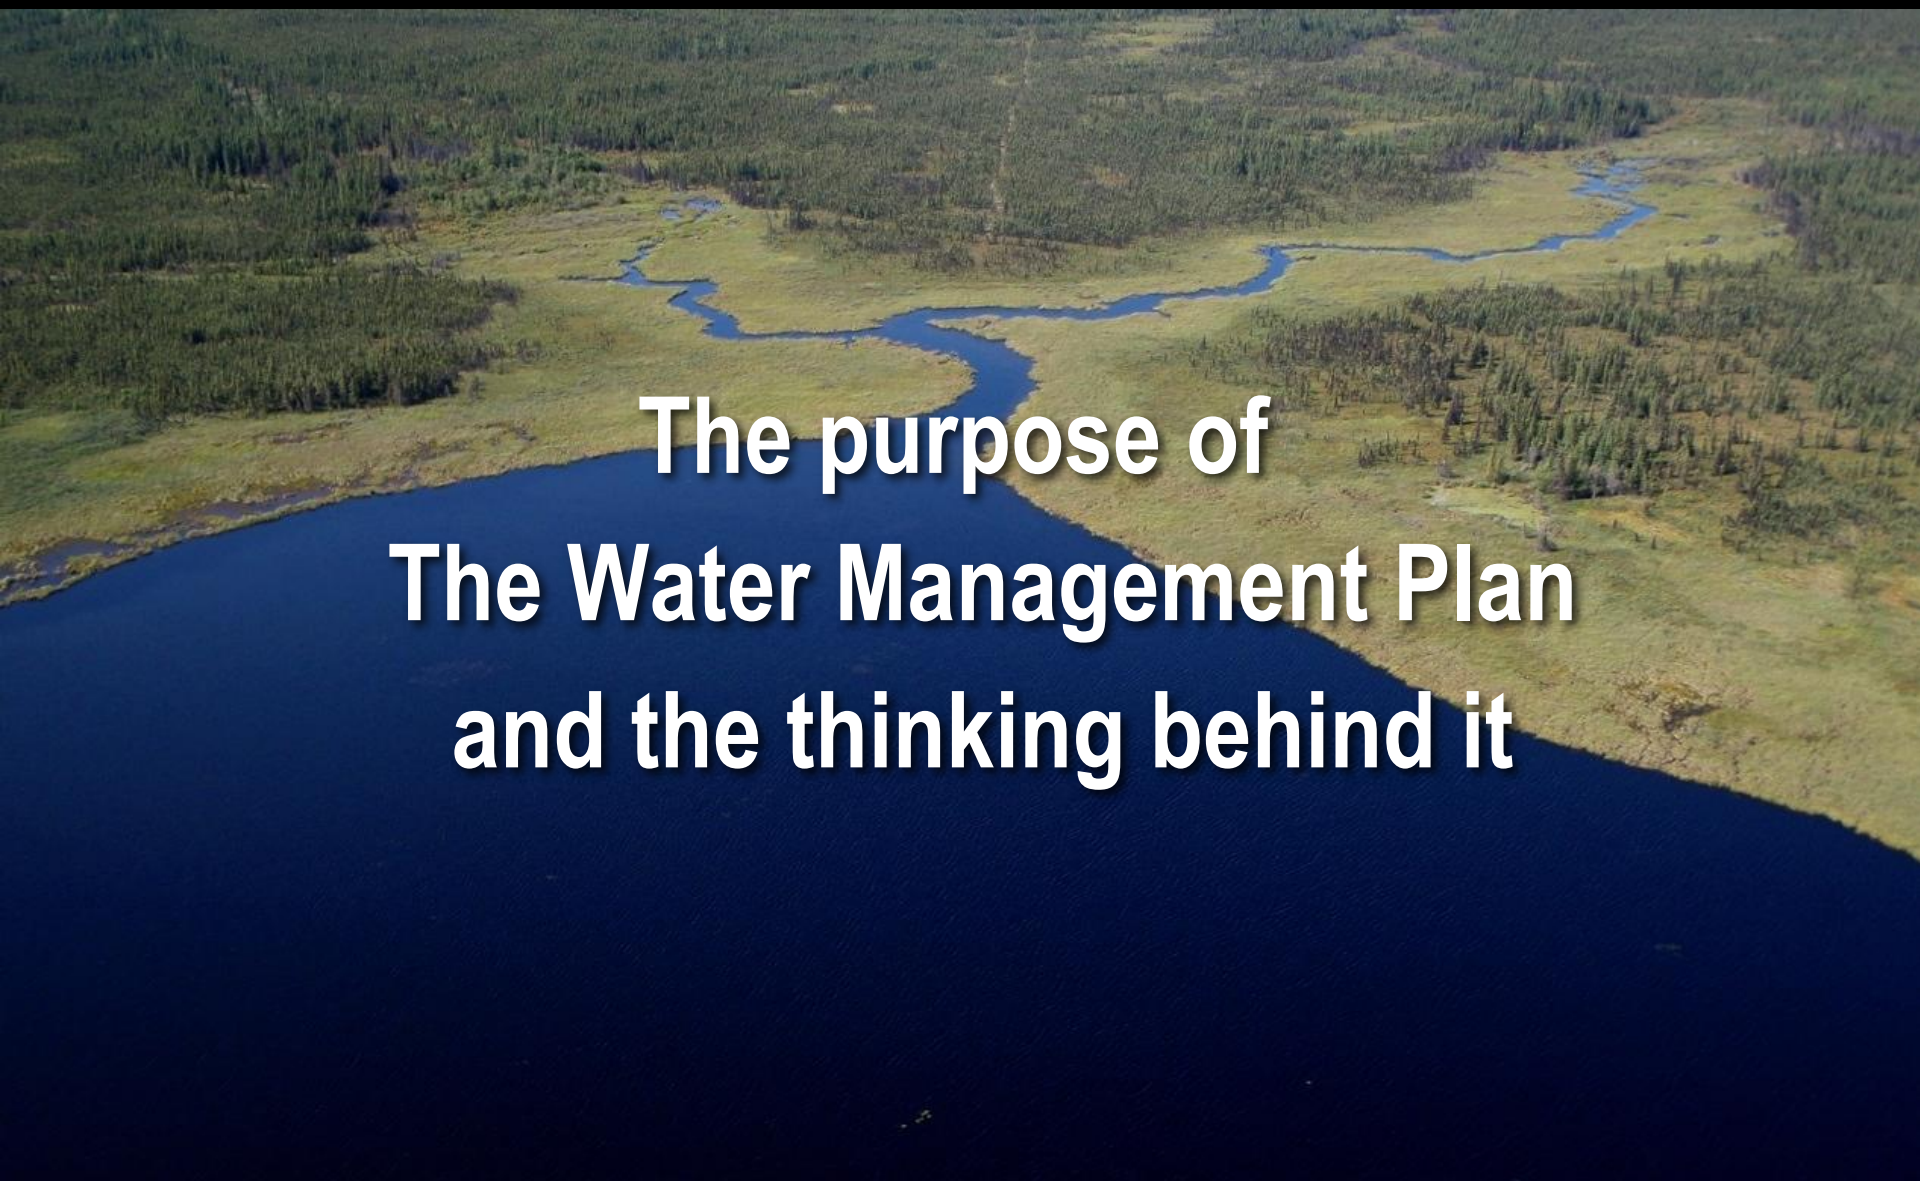

# 2011 FIELD WORK - OBJECTIVES

- Closely monitor downstream effects
- Study the catchment data to confirm water availability
- Develop the Rationale for The Water Management Plan
- Structure and quantify The Plan and submit it to FLNRO in support of our Water License application
- Test and verify the parameters used

# **RATIONALE WATER MANAGEMENT PLAN**

An aerial photograph showing a winding river flowing through a vast, green landscape. The river is a deep blue, contrasting with the surrounding green fields and dense forests. The terrain appears to be a mix of agricultural land and natural wilderness.

**The purpose of  
The Water Management Plan  
and the thinking behind it**

# **RATIONALE WATER MANAGEMENT PLAN**

**Preserve the natural integrity of the  
Tsea Lakes ecosystem**

# WATER MANAGEMENT PLAN

## RATIONALE

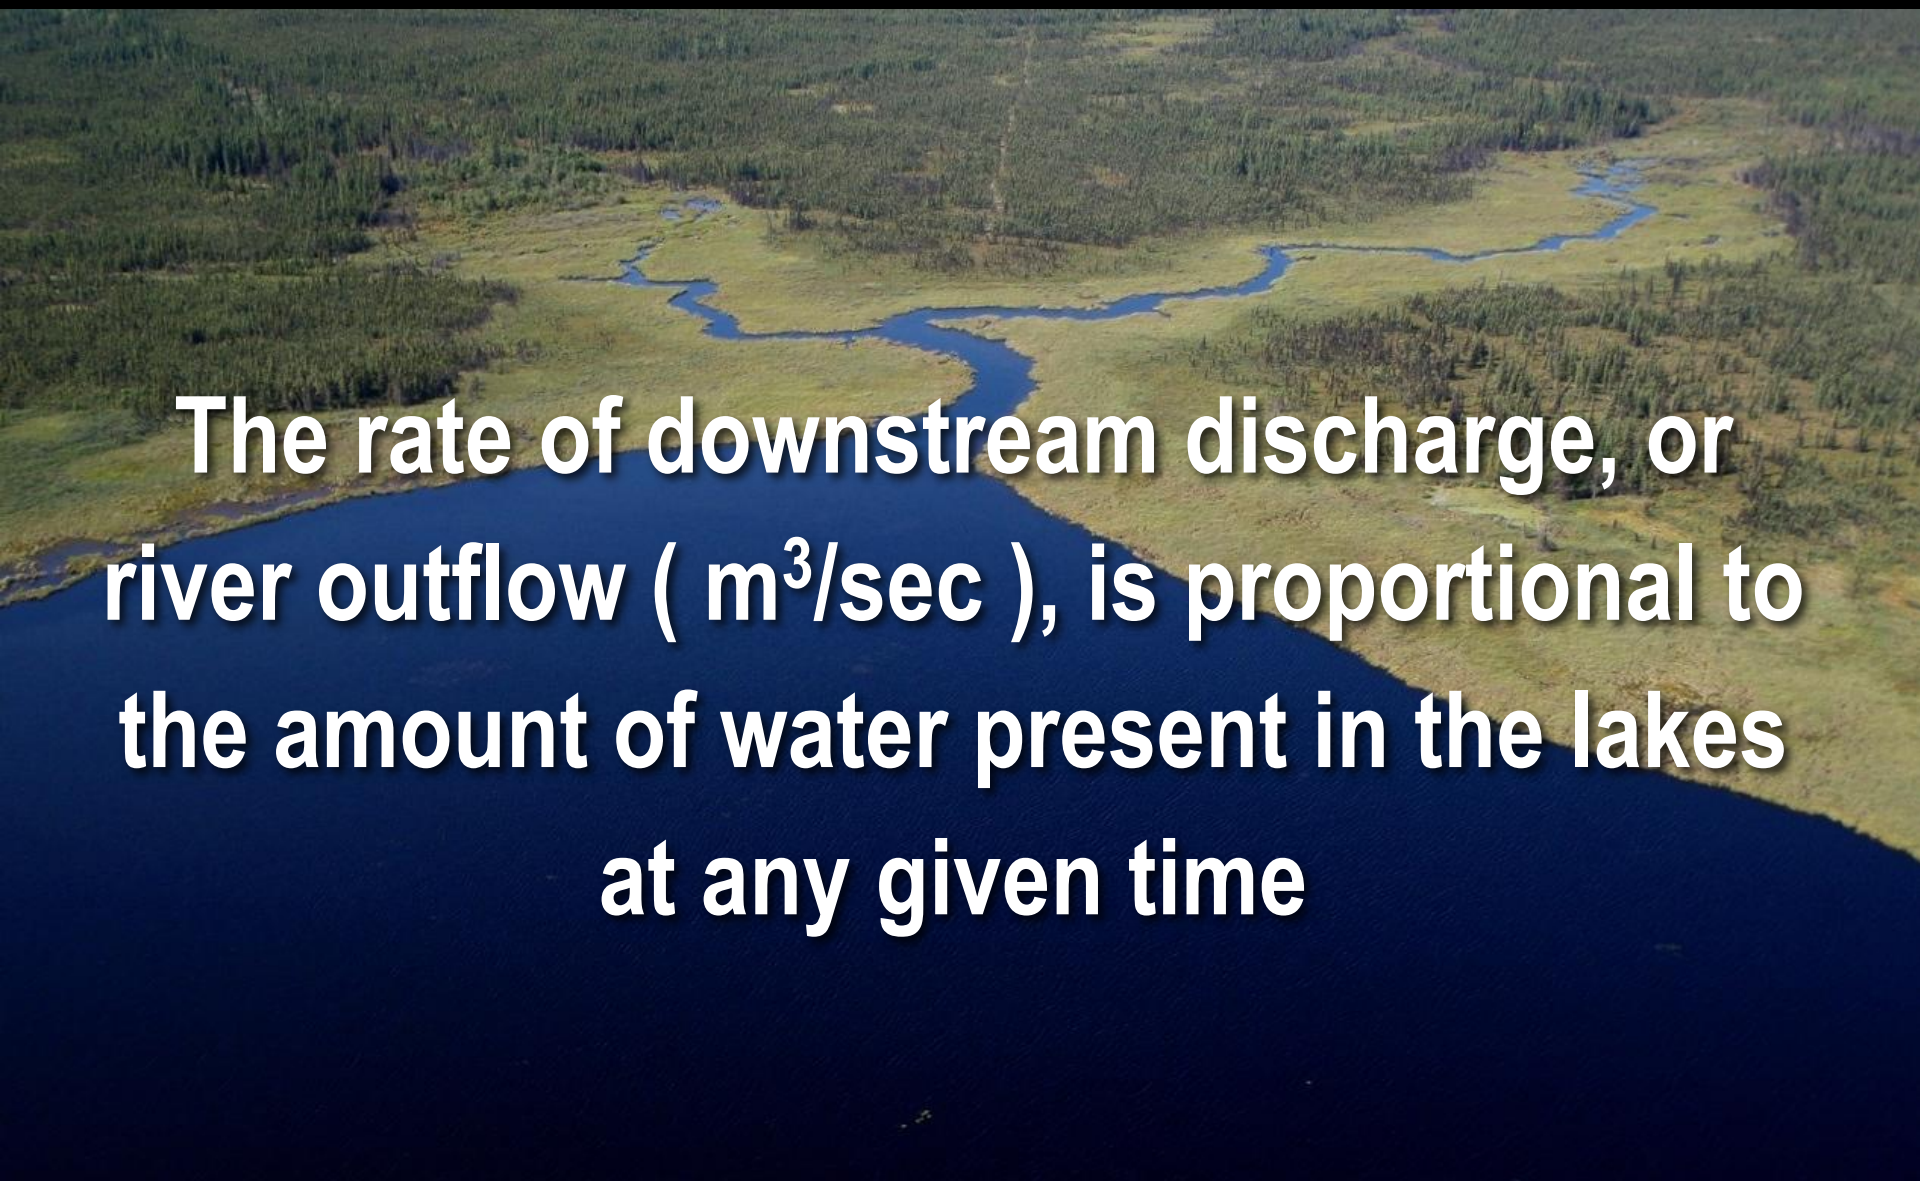

An aerial photograph showing a large, dark blue lake in the foreground. A winding river or stream flows from the lake through a green, forested landscape. The river meanders through the trees, creating a series of loops and turns. The surrounding area is densely forested with green trees, and the overall scene is a natural, undisturbed landscape.

**The lakes discharge water  
on a continual basis**

# WATER MANAGEMENT PLAN

## RATIONALE

The rate of downstream discharge, or river outflow (  $\text{m}^3/\text{sec}$  ), is proportional to the amount of water present in the lakes at any given time

# WATER MANAGEMENT PLAN

## RATIONALE

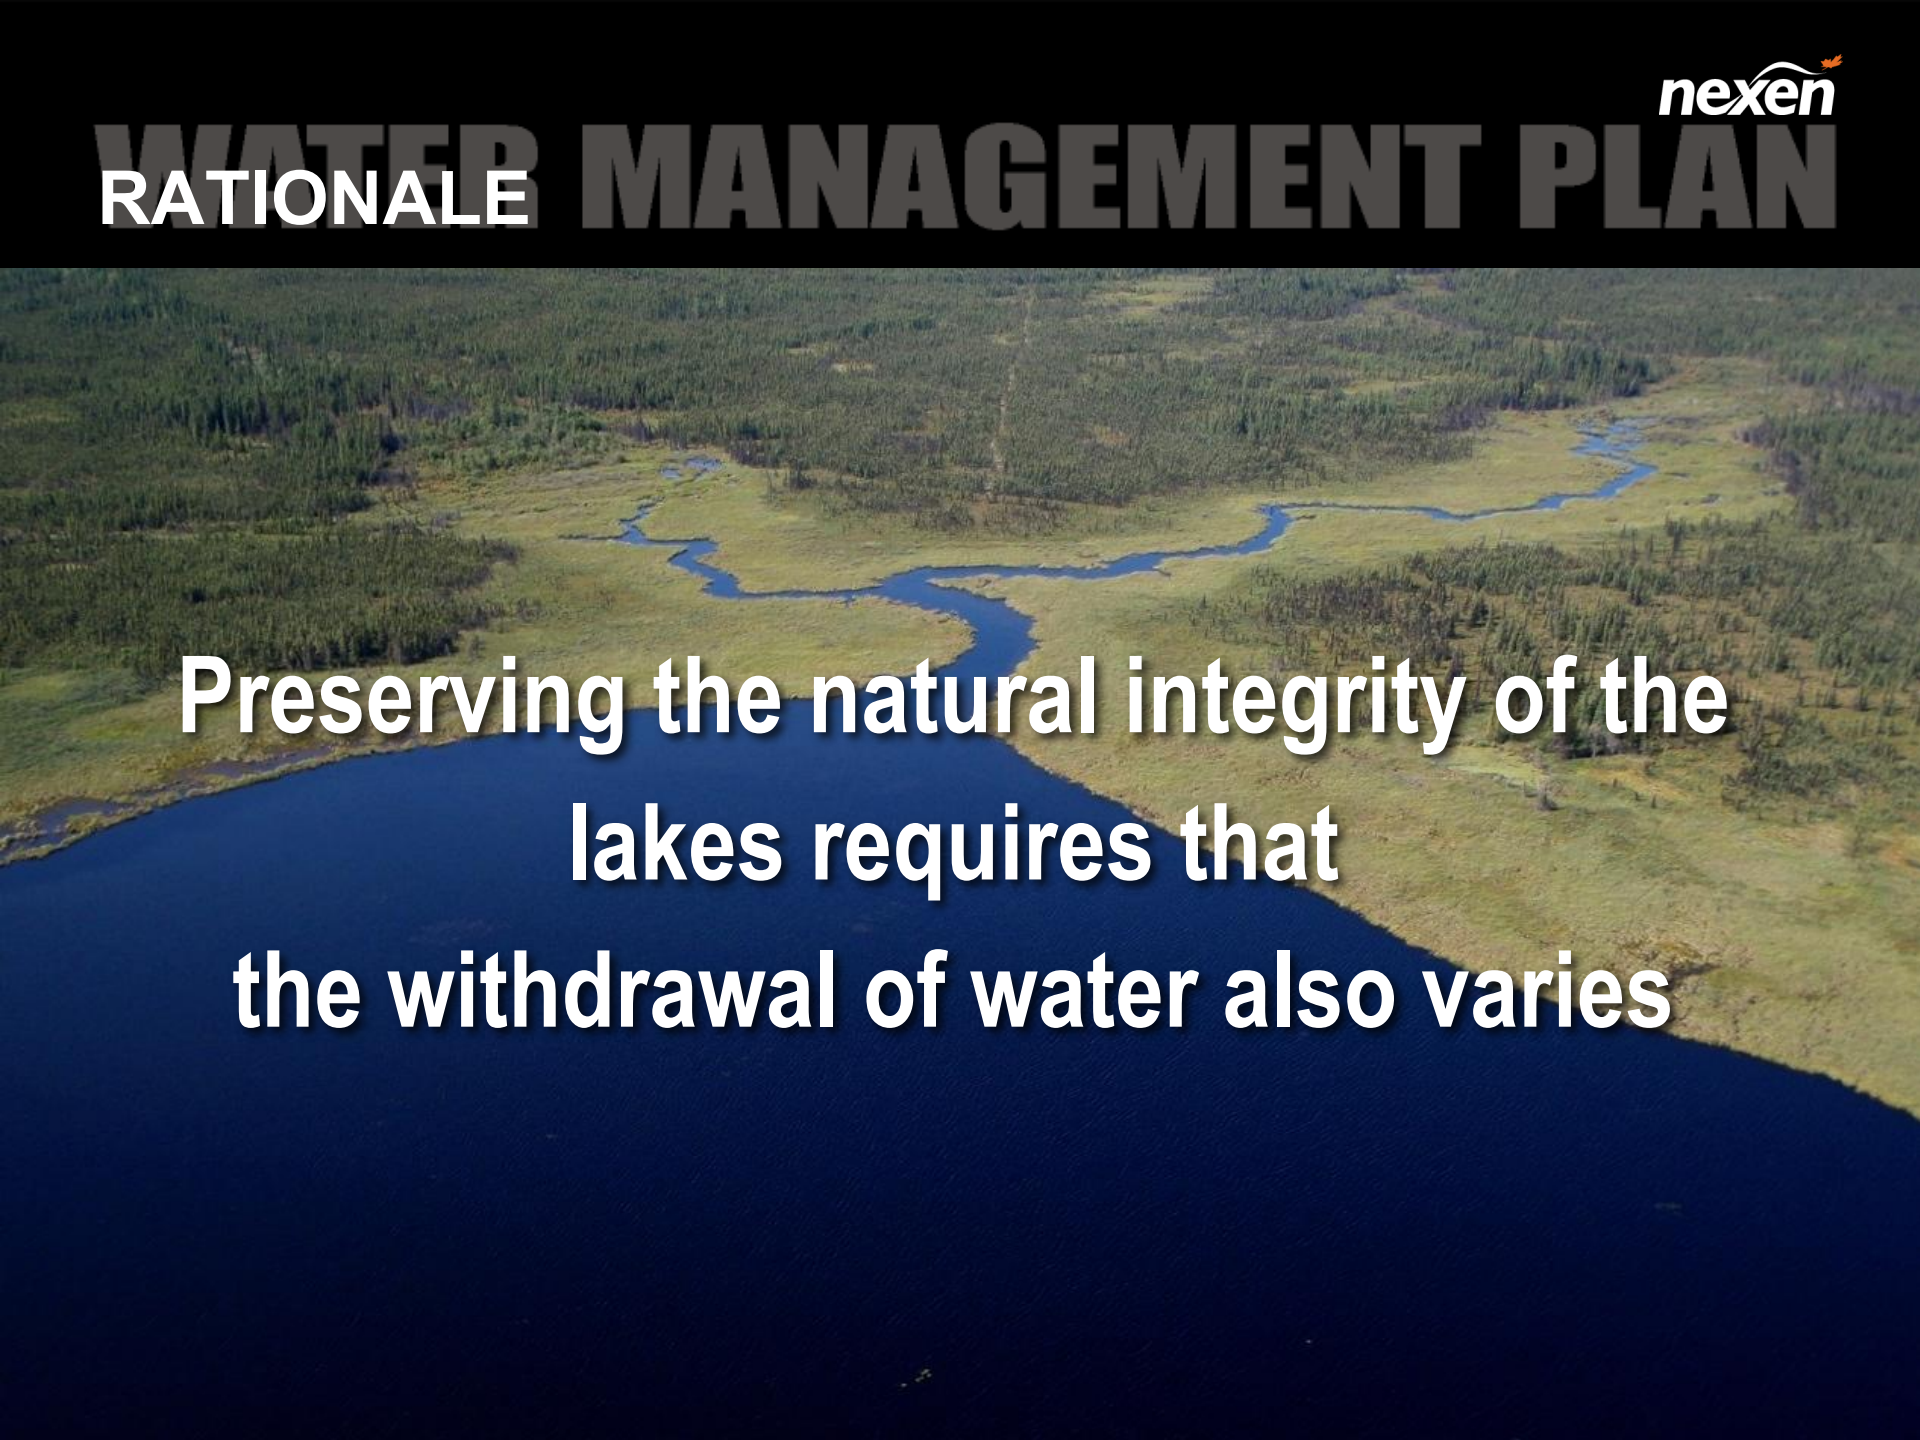

An aerial photograph showing a large, dark blue lake in the foreground. A winding river or stream flows from the lake into a vast, green forested area. The landscape is a mix of dense evergreen trees and open, grassy fields. The text is overlaid on the lake and the surrounding land.

**The amount of water in the lakes  
depends upon seasonal precipitation  
and varies throughout the year**

# WATER MANAGEMENT PLAN

## RATIONALE

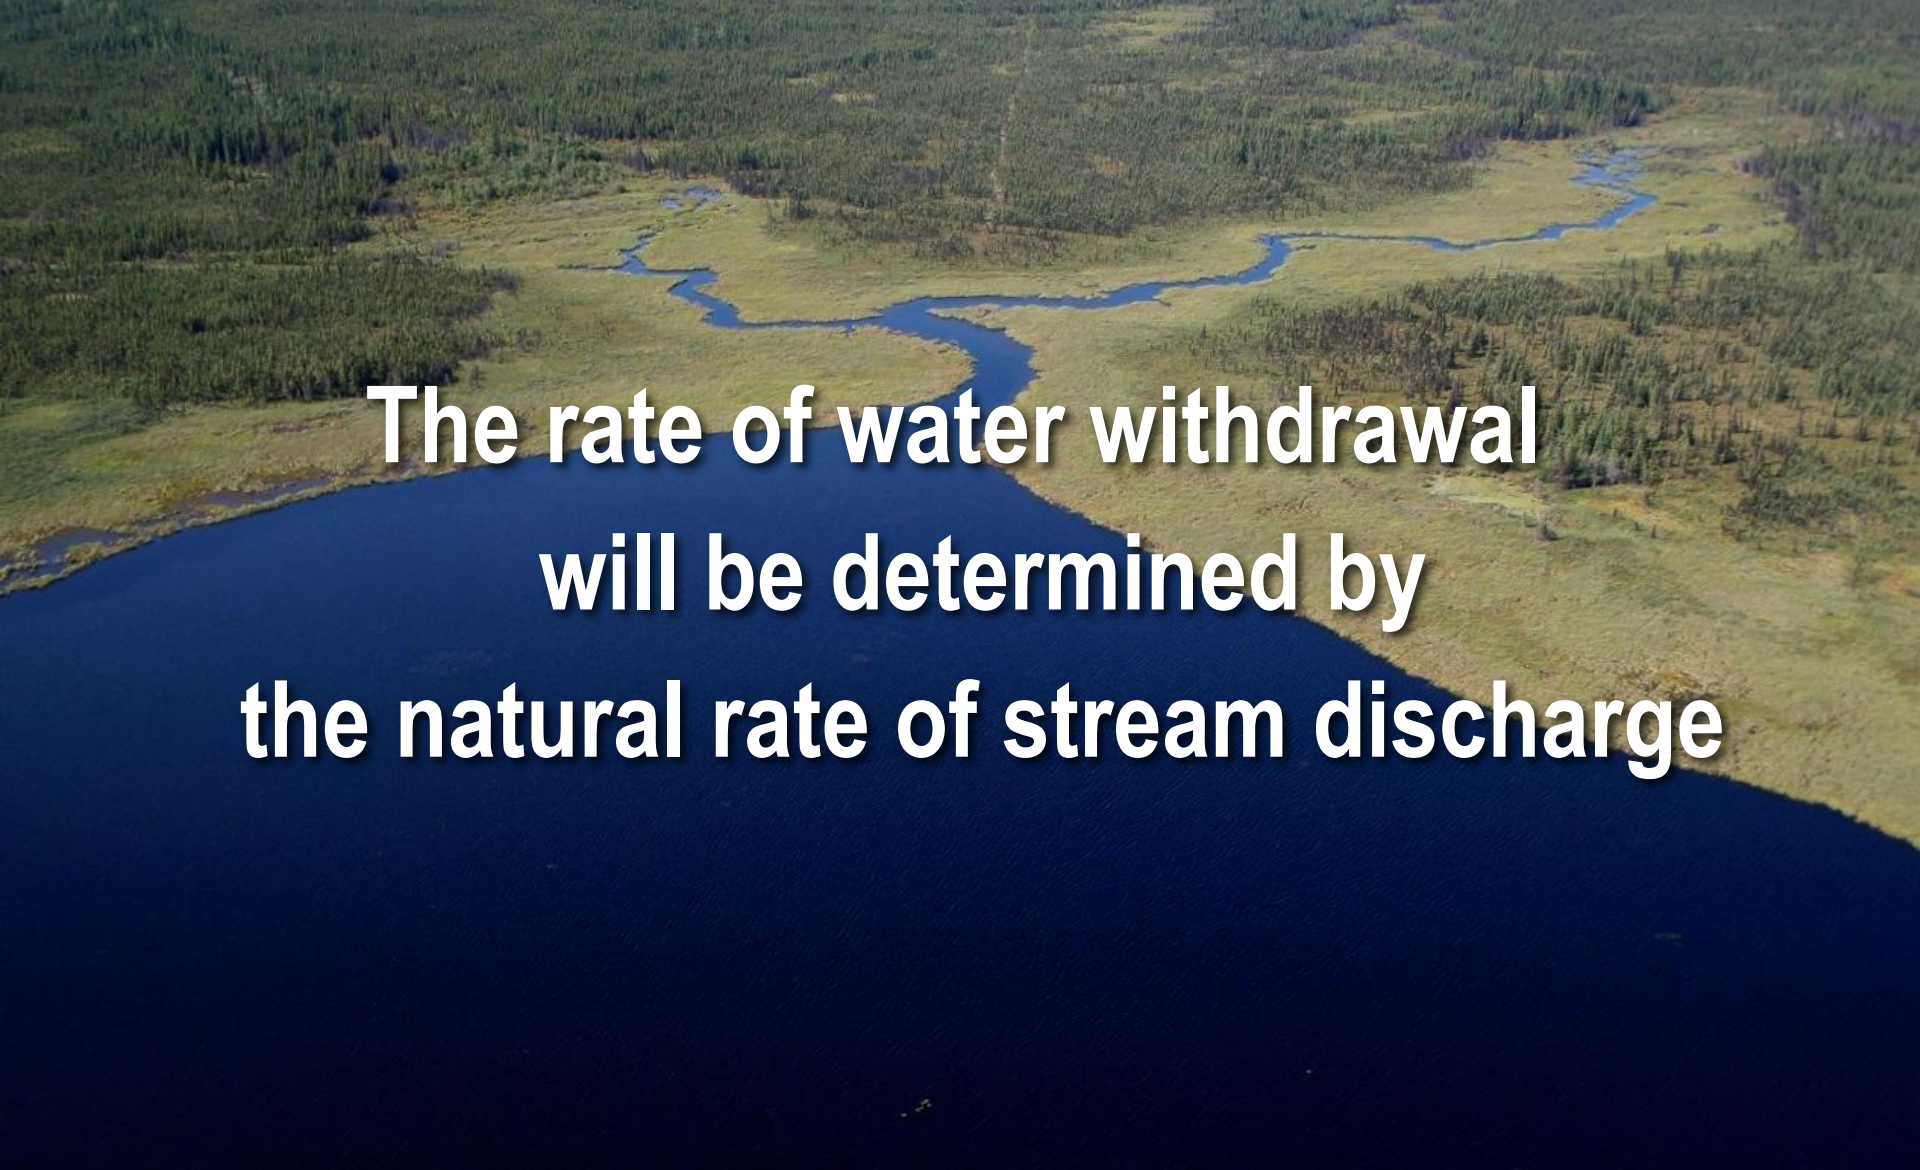

An aerial photograph showing a large, dark blue lake in the foreground, with a winding river or stream flowing through a green, forested landscape in the background. The river meanders through the trees, creating a series of loops and curves. The overall scene is a natural, undisturbed landscape.

**Preserving the natural integrity of the  
lakes requires that  
the withdrawal of water also varies**

# WATER MANAGEMENT PLAN

## RATIONALE

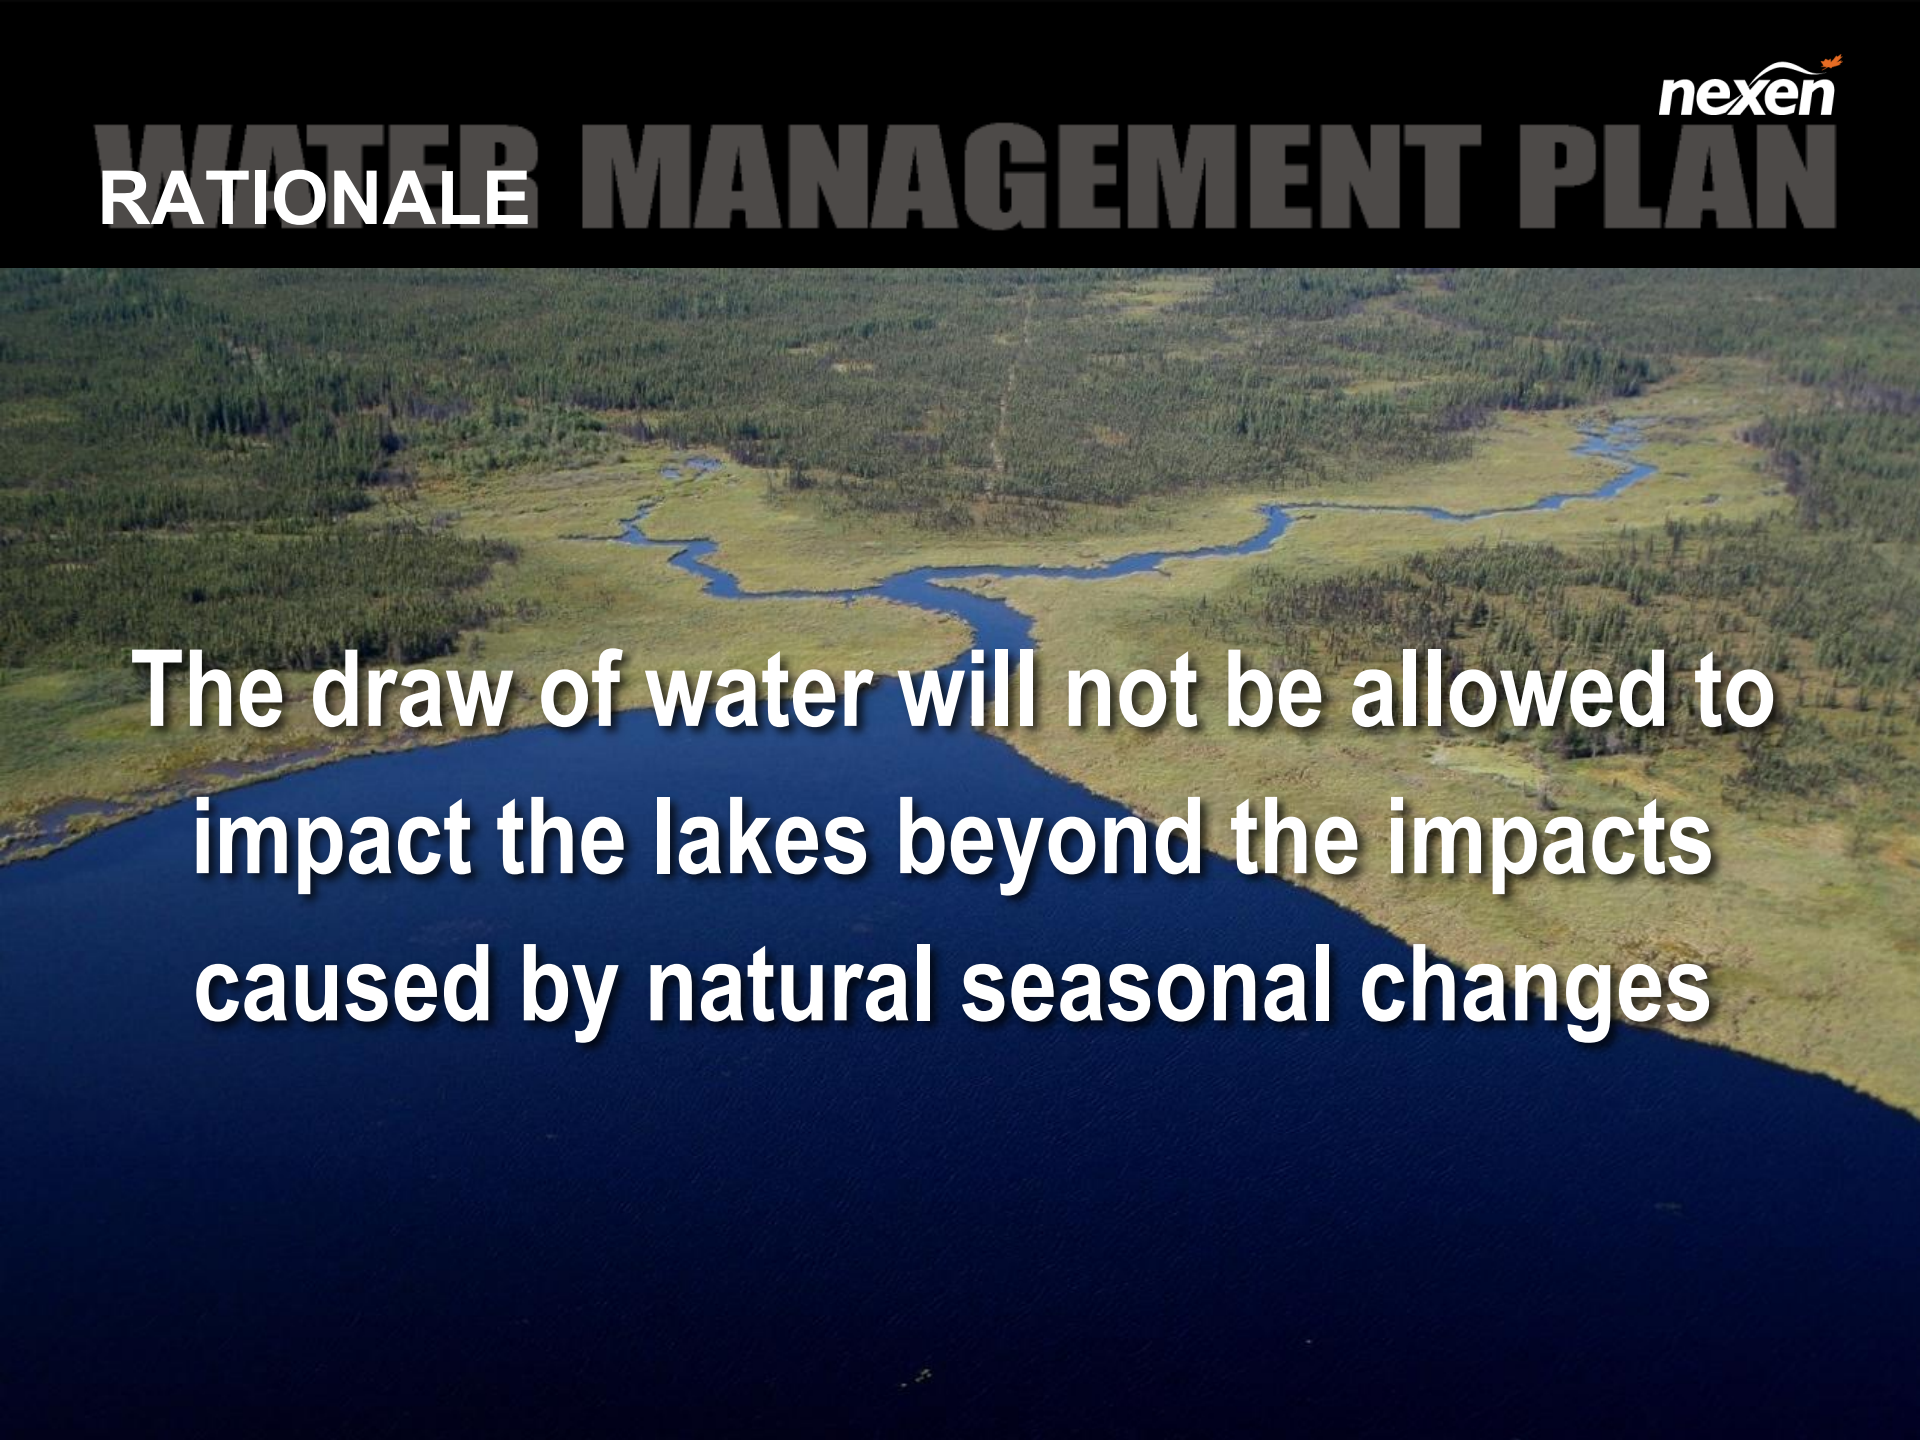

An aerial photograph showing a winding river or stream flowing through a vast, green, forested landscape. The river is a prominent blue line that meanders across the terrain, which is covered in dense green trees and vegetation. The river starts from the top right and flows towards the bottom left, where it widens into a larger body of water.

**The rate of water withdrawal  
will be determined by  
the natural rate of stream discharge**

# WATER MANAGEMENT PLAN

## RATIONALE

The draw of water will not be allowed to impact the lakes beyond the impacts caused by natural seasonal changes

# **RATIONALE WATER MANAGEMENT PLAN**

**Most water will be taken when the lakes  
are cycling through flood conditions**

***A 'Make Hay While the Sun Shines' Approach***

# WATER MANAGEMENT PLAN

## RATIONALE

Withdrawals may occur on  
a daily basis

# **RATIONALE WATER MANAGEMENT PLAN**

**Water withdrawn will be stored in  
borrow pits**

# **RATIONALE WATER MANAGEMENT PLAN**

**All water used for fracking will be drawn  
from these borrow pits**

## IMPACT MONITORING

In 2009, samples were taken across the region at various times to provide pre-impact baselines for periodic monitoring of...

**Water Quality**

**Fish**

**Birds**

**Mammals**

**Communities**

# WATER LICENSE - ADDITIONAL COMMITMENTS

## REPORTING

- Ministry of Environment

Nexen will provide the results of its monitoring program in an annual report and review

BRITISH  
COLUMBIA

The Best Place on Earth

- Fort Nelson First Nations and other Downstream Communities

Nexen will confer with community groups whenever requested, involve them in the monitoring program and, at a minimum, conduct an annual meeting and review of results

# 2012 FIELD WORK WATER MANAGEMENT PLAN

*Committing the Plan to Practice*

# WATER MANAGEMENT PLAN

## 2012 FIELD WORK - OBJECTIVES

- Complete the implementation of The Water Management Plan in anticipation of the Water License
- Add data to and understanding of the factors that effect the catchment and control water availability
- Monitor the downstream effects of The Water Management Plan
- Standardize the collection of data to achieve continuity with the provincial and federal monitoring programs

# WATER COLLECTION - FACILITIES

- An automatic interface is being installed to measure lake discharge and adjust the water withdrawal pump rate in accordance with The Water Management Plan
- This process is facilitated by the fact that both the discharge from the lake and the pump speed are measured in  $\text{m}^3/\text{sec}$

## **Water Management Plan**

**Dilly Creek Lease • Horn River Basin • NE British Columbia**

April 2012

# NEXEN & RESPONSIBLE DEVELOPMENT

*Nexen has a long-standing record of good stewardship and responsible resource development. These principles have been incorporated in the Water Management Plan*

- The company has a strong commitment to health, safety and the environment and social responsibility
- The primary rationale for The Water Management Plan is to preserve the integrity of the Tsea Lakes
- The current 'Debolt Solution' is unacceptable
- Nexen always looks for and invests in 'a better way'
- A measured approach to shale gas development... determined by economics...has been used as an opportunity to find a better Debolt water solution
- Site excavations are planned as borrow pits
- Borrow pits separate water demand from the source
- Our water license approach mitigates unintended, potentially harmful effects of short-term licensing
- Nexen is committed to impact monitoring, reporting to stakeholders and protecting the environment

A high-speed photograph of water splashing upwards, creating a dynamic and energetic background. The water is captured in mid-air, with numerous droplets and bubbles visible, giving it a sense of movement and freshness.
