Site Remediation Solutions
Large Scale Sulfolane-Impacted Soil Remediation at a Gas Plant

Guy Lavoie¹, Kirk Rockwell¹

¹Biogenie S.R.D.C. Inc., Sherwood Park Office, Alberta
Site History

- Large sour gas plant in central Alberta
- Operational from the 1960’s to present
  - natural gas, ethane, butane, propane, and CO₂
- Former operation involved Sulfinol® process
  - included process facilities, sump, and sulphur pit which were all dismantled prior to the project
- Sulfinol® process resulted in soil and groundwater contamination
- 2005 - client wanted to address the source area
Sulfinol® Process

- Process used since the 1960’s
- Removal of H₂S and other corrosive gases from natural gas streams
- Sulfinol utilizes sulfolane and diisopropanolamine (DIPA)
- Sulfolane is toxic, non-volatile, and water soluble
## Remedial Objectives

### Soil Quality Guidelines

Additional Site Assessment

Objectives:

• Additional site assessment to better delineate the sulfolane and sulphur plume, as well as metals
• Better understand the two main contaminants in relation to specific site characteristics
• Select the best technology and remediation strategy
Findings of ESA

- Sulfolane impacted soil volume of 12,100 m³
- Metals impacted soil volume of 275 m³
  - As, Cr^{6+}, and Ni
- Elemental sulphur impacted soil volume of 6,200 m³
- Groundwater impacts with sulfolane
Site Specific Challenges

- Plant operation concerns (safety)
  - numerous overhead, surface, and underground structures
- Large volume of impacted material
- Limited space available on site
- Several types of contaminants
- Volume of soil was not completely delineated
- Time to perform the overall work
- Treatment performance (pay-per-performance) – risk involved
Sulfolane Remediation Strategy

1. *In situ* biotreatment of 12,100 m³ of sulfolane-impacted soil
   - installation of subsurface aeration system
   - addition of nutrient amendments
   - periodic soil tilling
   - monitoring of equipment and soil conditions
   - third party groundwater monitoring

2. Segregation of off-site disposal of 275 m³ of impacted soil with metals
Advantages

1. Soil treatment to below sulfolane detection limit
2. Improved groundwater quality
3. Maximize space available
4. Minimize soil handling
5. Minimize use of landfill and backfill
6. Increased safety from decreasing truck traffic near the plant
7. Control of physical and biological parameters
8. Short timeframe for treatment
CROSS-SECTION OF THE *IN SITU* BIOTREATMENT

## Sulfolane Remediation Results

<table>
<thead>
<tr>
<th>Sulfolane Concentration</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial maximum</td>
<td>755 mg/kg</td>
</tr>
<tr>
<td>Initial minimum</td>
<td>6.5 mg/kg</td>
</tr>
<tr>
<td>Initial mean</td>
<td>138 mg/kg</td>
</tr>
<tr>
<td>Final concentration</td>
<td>&lt;2 mg/kg</td>
</tr>
</tbody>
</table>

Total treatment time was 6 months
Sulfolane Concentration

Sulfolane Concentration in Soil Over Time

Mean Initial Concentration: 138 mg/kg
3 Month Mean Concentration: 46 mg/kg
Final Concentration: <2 mg/kg

Detection Limit = 2 mg/kg
Sulphur Remediation Strategy

- **In situ** chemical stabilization of 6,200 m³ of sulphur-impacted soil
  - addition of “zero grind” limestone at a ratio of 3.2 mg/kg limestone : 1 mg/kg sulphur
- Elemental sulphur concentrations ranged from 200 mg/kg to 28,000 mg/kg
Advantages

1. Minimize use of landfill and backfill
2. Maximize space available
3. Increased safety by decreasing truck traffic near the plant
Project Results

Overall:

• Safety: no recordable incidents
• Quality: all remedial objectives achieved
• Cost: within the original budget and less than alternative methods
• Time: completed in 6 months (expected 8 months)

100% of the objectives were achieved
